**UV-vis Behaviour:** The binding behaviour of the ligand/receptor with different cations was studied in CH$_3$CN-HEPES buffer (8/2, v/v, 25°C) at pH = 7.4. The UV-vis titration experiment was carried out in mixed aqueous media at $1 \times 10^{-5}$ M concentration of receptor solution upon addition of incremental amount of 7 equiv of Zn$^{2+}$($2 \times 10^{-4}$ M). The UV-vis spectrum of the receptor exhibits peaks at 487nm and 500nm. Upon gradual increase of the Zn$^{2+}$ ion concentration, exhibits a red shift from 487 nm and 500nm.
**JOB’S PLOT:**

Job plot shows a maxima at 0.4 mole fraction of the receptor. This value indicates compound 1 and Zn$^{2+}$ exists in a multiple equilibrium between a 1:1 and 1:2 complex.

Fluorescence titration:

For fluorescence titrations, stock solution of the sensor ($c = 1 \times 10^{-5}$ M) was prepared for the titration of cations in CH$_3$CN-HEPES buffer (6/4, v/v, 25ºC) at pH 7.4. The solution of the guest cations using their chloride (Fe, Cr, Mg, Hg, Pb, Al, Cd) and perchlorate (Zn, Ni, Mn, Cu, Na) salts in the order of 200 μM were also prepared. Solutions of various concentrations containing sensor and increasing concentrations of cations were prepared separately. The spectra of these solutions were recorded by means of fluorescence methods.
