**General.** All reactions were carried out with standard Schlenk techniques under a nitrogen atmosphere. Column chromatography was performed on Wakogel® C-200 (75–150 μm). Preparative thin-layer chromatography was performed on Wakogel® B-5F. Proton chemical shifts were referenced to residual CHCl₃ signal at 7.26 ppm. Carbon chemical shifts were referenced to CDCl₃ at 77.0 ppm. Melting points were not corrected.

**Materials: Preparation of Substituted Maleic Anhydrides 2.** Substrates 2 were synthesised by palladium-catalysed addition of arylboronic acids to dimethyl acetylenedicarboxylate,¹ and subsequent hydrolysis followed by dehydration.²
