7. 2D NOESY NMR spectrum of 1$\supseteq_{}$G S9
8. A photo showing color changes after host-guest complexation S10
1. Materials and methods:

Pillar[10]arene 2, 3 were synthesized according to literature procedures. Solvents were either employed as purchased or dried according to procedures described in the literature. $^1$H NMR spectra were collected on a temperature-controlled 400 MHz spectrometer. $^{13}$C NMR spectra were recorded on a Bruker AVANCE DMX-500 spectrometer at 125 MHz. Low-resolution electrospray ionization (LRESI) mass spectra were obtained on a Bruker Esquire 3000 plus mass spectrometer (Bruker-Franzen Analytik GmbH Bremen, Germany) equipped with an ESI interface and an ion trap analyzer. High-resolution mass spectrometry experiments were performed with a Bruker Daltonics Apex III spectrometer. UV-vis spectroscopy was performed on a Shimadzu UV-2550 instrument at room temperature. The fluorescence experiments were conducted on a RF-5301 spectrofluorophotometer (Shimadzu Corporation, Japan).

2. Synthetic route to pillar[10]arene 1

![Scheme S1 Synthetic route to pillar[10]arene 1.](image)

To a solution of 3 (0.50 g, 0.28 mmol) in dried chloroform (25 mL) was added largely excessive boron tribromide. The mixture was stirred at room temperature for 12 h. Then the mixture was added into ice water. The resulting precipitated product 2 was collected by filtration, washed with water and dried completely under vacuum.
Per-Hydroxylated pillar[10]arene 2 (0.25 g, 0.21 mmol) was dissolved in CH₃CN (50 mL). K₂CO₃ (0.85 g, 6.2 mmol) was added and the reaction mixture was stirred. Then 2-methoxyethyl p-toluenesulfonate (1.4 g, 6.2 mmol) was added and the reaction mixture was stirred under N₂ at reflux for 3 days. The solvent was evaporated and the residue was dissolved in CH₂Cl₂. The resultant solution was washed with H₂O and brine. The organic phase was collected, dried over anhydrous Na₂SO₄ and concentrated to give a crude solid. Column chromatography (silica gel; CH₂Cl₂ : CH₃OH = 40 : 1 ) afforded a light yellow solid (150 mg, 30%). M.p. 110.3–112.7 °C.

The ¹H NMR spectrum of pillar[10]arene 1 is shown in Figure S1. ¹H NMR (400 MHz, CDCl₃, room temperature) δ (ppm): 6.69 (s, 12H), 3.91 (t, J = 8.0 Hz, 24H), 3.85 (s, 12H), 3.59 (t, J = 8.0 Hz, 24H), 3.30 (s, 36H). The ¹³C NMR spectrum of pillar[10]arene 1 is shown in Figure S2. ¹³C NMR (100 MHz, CDCl₃, room temperature) δ (ppm): 150.95, 128.35, 114.94, 71.35, 68.05, 59.01, 29.85. LRESIMS: m/z 2402.5 [M + Na]⁺ (100%). HRMALDIIMS: m/z calcd. for [M + Na]⁺ C₁₃₀H₁₈₀O₄₀Na, 2404.1948, found 2404.1482.

**Fig. S3** LRESI mass spectrum of pillar[10]arene 1. Assignment of the main peak: $m/z$ 2402.5 [M + Na]$^+$ (100%).
4. Stoichiometry and association constant determination for the complexation between I and G

To determine the stoichiometry and association constant for the complexation between I and G, fluorescence titration experiments were done with solutions which had a constant concentration of G (5.00 × 10⁻⁶ M) and varying concentrations of I. By a non-linear curve-fitting method, the association constant ($K_a$) of $I \rightleftharpoons G$ was determined. By a mole ratio plot, 1:1 stoichiometry was obtained for the complexation between I and G.

The non-linear curve-fitting was based on the equation:\textsuperscript{S2}

$$\Delta F = \left( \Delta F_\infty / [G]_0 \right) \left( 0.5[H]_0 + 0.5([G]_0+1/K_a) - (0.5 ([H]_0^2 + (2[H]_0 (1/K_a - [G]_0)) + (1/K_a + [G]_0)^2)^{0.5} ) \right)$$

Where $\Delta F$ is the fluorescence intensity change at 405 nm at $[G]_0$, $\Delta F_\infty$ is the fluorescence intensity change at 405 nm when G is completely complexed, $[H]_0$ is the initial concentration of I, and $[G]_0$ is the fixed initial concentration of G.
