Supporting information

β-Cyclodextrin/TiO₂: Green Nest for Reduction of Nitroaromatic Compounds

Mazaher Abdollahi Kakroudi, Foad Kazemi, Babak Kaboudin

Table of Contents:

1. Materials and Apparatuses
2. General experimental procedure for photocatalytic reduction of nitroaromatic compounds
3. General procedure for one-pot photo-reductive N-formylation and N-acylation of nitroaromatic compounds
4. UV-Vis analysis of o-amino phenol and o-nitro phenol with addition of β-CD solution
5. TGA curve for the β-CD-TiO₂
6. DRS (Diffuse reflectance spectra) of the β-CD-TiO₂
7. Nitrogen adsorption-desorption isotherm of the β-CD-TiO₂
8. TEM images of TiO₂ P25 and β-CD-TiO₂
9. Raman spectroscopy of β-CD-TiO₂ and TiO₂ P25
10. FT-IR spectroscopy of β-CD-TiO₂ and TiO₂ P25
11. ¹³C NMR and ¹H NMR of the amide products
1. Materials and Apparatuses

All the reagents purchased from Merck, Aldrich and used without further purification. TiO$_2$ p25 was purchased from Degussa.

N$_2$ adsorption–desorption isotherms were obtained at 77 K using BELSORP max apparatus. UV-Visible diffusive reflectance spectra (DRS) were measured on Varian Cary 100 UV-Vis spectrophotometer with diffuse reflectance accessory, samples were mixed in BaSO$_4$ (1:20 sample BaSO$_4$) and pressed into a tablet, a BaSO$_4$ tablet made under the same conditions was used as a reference. The photoluminescence (PL) spectra were measured at 25 °C with a fluorospectrophotometer (Varian) using Xe lamp as an excitation source. Photocatalytic reduction test was also carried out under daily sunlight irradiation (9 am–3pm, sunlight intensity between 10-80×10$^3$ Lux).

2 General experimental procedures for photocatalytic reduction of nitro compounds under sunlight irradiations

$\beta$-CD (0.1 mmol) was dissolved in water (15 ml) by warming to 60 °C until a clear solution was formed. Nitro compounds (0.1 mmol) were added to this solution and were sonicated for 10 min. Then, commercial TiO$_2$ (P25) (30 mg) and oxalic acid (15 mg) was added into a round bottom Pyrex flask (25 ml). The reaction mixture was degassed by Ar gas (20 min) and sealed with a septum. Afterwards, the flask was irradiated under stirring with sunlight according to the data in Table1. After the completion of the reaction, a suitable amount of NaHCO$_3$ were added pH to control the around 7 and the mixture was stirred at room temperature. The organic material was extracted with ethyl acetate. The organic phase was then dried using anhydrous MgSO$_4$. The reaction mixture was analyzed with Gas Chromatograph.

**Fig S1.** Reduction of nitro compounds using $\beta$-CD-P25 TiO$_2$ under sunlight irradiations in water.
The mole ratio of nitro to ammonium formate is 1 to 3.2 and nitro to oxalic acid is 1 to 1.7. The ammonium formate and oxalic acid convert to ammonia, carbon dioxide or carbon dioxide during photocatalytic reaction respectively. We found that, in experimental control test, when the reaction carried out in the presence of excess amount of ammonium formate, amine product was obtained in quantitative yield after separation by extraction with EtOAc. The aqueous phase including excess of ammonium formate can be used for next reduction cycle without loss of the conversion yield.

Scheme S1. Two cycles reduction of 3-nitroacetophenone in the presence of excess amount of ammonium formate.

3. General procedure for one-pot N-formylation and N-acylation of nitro compounds under sunlight irradiations

β-CD (0.1 mmol) was dissolved in water (15 ml) by warming to 60 °C until a clear solution was formed. Nitro compounds (0.1mmol) were added to this solution and were sonicated for 10 min. Commercial TiO₂ (P25) (30 mg), ammonium formate (25 mg) and triethy orthoformate (0.2 ml) for formylation or anhydride (0.12 mmol) were added into a round bottom Pyrex flask (25 ml). The reaction mixture was degassed by Ar gas (20 min) and sealed with a septum. Afterwards, the flask was irradiated under stirring with sunlight according to the data in Table 3. The organic material was extracted with ethyl acetate. The organic phase was then dried (anhydrous MgSO₄), filtered, and the solvent was removed under vacuum. Pure products were obtained after recrystallization or by column chromatography on silica using the n-hexane and ethyl acetate mixture as an eluent (SiO₂; n-Hexane, EtOAc 5:1).

$N$-phenylbenzamide

Melting point: 159–161 °C, (162 °C); IR (KBr): ν3340, 1655, 1593, 1526, 1434, 1316, 1255, 1025, 803, 751, 686, 646, 503 cm$^{-1}$; $^1$H-NMR (250 MHz; CDCl$_3$; TMS): δ$_H$ = 7.87 (d, $J$ = 6.75 Hz, 3H), 7.65 (d, $J$ = 7.75 Hz, 2H), 7.58-7.46 (m, 3H), 7.38 (t, $J$ = 7.5 Hz, 2H), 7.16 (t, $J$ = 7.25 Hz, 1H); $^{13}$C-NMR (62.9 MHz, CDCl$_3$; TMS): δC = 209, 165.0, 157.0, 131.9, 129.1, 128.8, 127.0, 124.6, 120.1.

**Fig S11.** FT-IR Spectra of P25 TiO$_2$
**N-phenylacetamide**

Melting point: 112–114 °C, (114–115 °C); $^1$H-NMR (250 MHz; CDCl$_3$; TMS): $\delta$H = 7. (d, $J$=7.75 Hz, 2H), 7.32 (t, $J$=7.5 Hz, 2H), 7.11 (t, $J$=7.25 Hz, 1H), 2.19 (s, 3H); $^{13}$C-NMR (62.9 MHz, CDCl$_3$; TMS): $\delta$C = 168.5, 137.9, 129.0, 124.3, 119.9, 24.5.

**N-(p-tolyl) acetamide**

Melting point: 151–154 °C, (151 °C); $^1$H-NMR (250 MHz; CDCl$_3$; TMS): $\delta$H = 7.37 (d, $J$=8 Hz, 2H), 7.11 (d, $J$=8 Hz, 2H), 2.31 (s, 3H), 2.15 (s, 3H); $^{13}$C-NMR (62.9 MHz, CDCl$_3$; TMS): $\delta$C = 168.3, 135.3, 133.9, 129.4, 120.0, 24.5, 20.8.

**N-(4-benzoylphenyl) acetamide**

Boiling Point: 459 °C; $^1$H-NMR (250 MHz; CDCl$_3$; TMS): $\delta$H = 10.04 (s, 1H), 7.21-7.66 (m, 9H), 1.73 (s, 3H); $^{13}$C-NMR (62.9 MHz, CDCl$_3$; TMS): $\delta$C = 195.5, 168.5, 137.6, 136.7, 132.9, 132.1, 131.3, 130.2, 129.9, 128.5, 124.5, 124.0, 23.5.

**N-(2-acetylphenyl) benzamide**

Boiling Point: 367.4 °C; $^1$H-NMR (250 MHz; CDCl$_3$; TMS): $\delta$H = 10.04 (s, 1H), 7.21-7.66 (m, 9H), 1.73 (s, 3H); $^{13}$C-NMR (62.9 MHz, CDCl$_3$; TMS): $\delta$C = 195.5, 168.5, 137.6, 136.7, 132.9, 132.1, 131.3, 130.2, 129.9, 128.5, 124.5, 124.0, 23.5.
2-Methylbenzimidazole

$^1$H NMR (400 MHz, CDCl$_3$): $\delta$ 2.67 (s, 3 H), 7.26 (m, 2 H), 7.57 (m, 2 H), 8.42 (b, s, 1 H); $^{13}$C NMR (100 MHz, CDCl$_3$): $\delta$ 14.8, 114.4, 122.3, 138.4, and 151.0.

All $N$-formamide products gave satisfactory spectroscopic data according to the literature [1-6].

$N$-p-tolyiformamide

Melting point: 52-54°C

$N$-phenylformamide

Melting point: 48-50°C

$N$-(4-Hydroxyphenylformamide)

Melting point: 140-143 °C
