General information:

Reagents and solvents were purchased from commercial sources (Aldrich and Merck) and used without further purification. Copper (I) iodide (99.999 % purity) and Stannous chloride dihydrate (>99.99 % purity) were purchased from Sigma-Aldrich and used as such without further purification. All reactions were carried out in reaction vessels with magnetic stirring and no special precautions were taken to exclude air from the reaction vessels. The reactions were monitored by thin layer chromatography. Analytical TLC was performed on pre-coated aluminium sheets of silica gel 60F₂₅₄ of 0.2 mm thickness (Merck, Germany). Flash column chromatography was performed on silica gel (230-400mesh), SRL, India. Melting points were determined on Gallenkamp meltingpoint apparatus using capillary tubes and are uncorrected. ¹HNMR (400MHz) and ¹³CNMR (100MHz) spectra were recorded in CDCl₃/TMS solution with TMS as internal standard on a Bruker spectrometer. Mass spectra were recorded using ESI/HRMS at 60000 resolutions in Thermo scientific Exactive mass spectrometer. Elemental analyses were recorded using a Thermo Finnigan FLASH EA1112 CHN analyzer.
Typical experimental procedure for the preparation of quinoline (4a-m): N-alkyl propargylamines were prepared according to the similar procedure as reported. A mixture of copper iodide (15 mol %), 2-nitrobenzaldehyde 1 (1.0 mmol), piperidine 2 (1.2 mmol) and alkyne 3 (1.2 mmol) in toluene was heated at 100°C for 3h. Then the reaction mixture was cooled to rt and the solvent was removed then used directly without further purification. The reaction mixture of N-alkyl propargylamine 5 was dissolved in 5 ml of ethanol and added SnCl₂.2H₂O (4.0 mmol) then heated at 70°C for 2h. After the completion of reaction it was filtered through celite by washing with ethylacetate and added water (50ml) extracted with same solvent (2x20ml). The combined organic layer washed with saturated NaOH and brine solution and dried over anhydrous Na₂SO₄ and concentrated under reduced pressure. The crude material was purified by column chromatography on silica gel using petroleum ether/ethyl acetate (5-20%) to afford quinoline derivatives in 62-89 % yield. All the prepared compounds were characterized by NMR and Mass spectroscopy techniques.

Typical experimental procedure for the preparation of propargylamine from dibenzylamine and its conversion to quinoline

A mixture of copper iodide (15 mol %), 2-nitrobenzaldehyde 1 (1.0 mmol), dibenzylamine 6 (1.2 mmol) and alkyne 3 (1.2 mmol) in toluene was heated at 100°C for 3h. Then the reaction mixture was cooled to rt and the solvent was removed then used directly without further purification. The reaction mixture of N-alkyl propargylamine was dissolved in 5 ml of ethanol and added SnCl₂.2H₂O (4.0 mmol) then heated at 70°C for 2h. After the completion of reaction it was filtered through celite by washing with ethylacetate and added water (50ml) extracted with same solvent (2x20ml). The combined organic layer washed with saturated NaOH and brine solution and dried over anhydrous Na₂SO₄ and concentrated under reduced pressure. The crude material was purified by column chromatography on silica gel using petroleum ether/ ethyl acetate (5-20%) to afford quinoline derivatives in 83 % yield.

Typical experimental procedure for the preparation of propargylamine from n-butylamine and its conversion to quinoline

In a 50ml RB flask was added CuI (15 mol %). The reaction vessel was sealed and flushed with N₂. Then added EtOH (0.15 mL), aldehyde 1 (1.0 mmol), and amine 7a/7b (1.2 mmol).
The reaction mixture was allowed to stir at room temperature for approximately 30 sec. and then alkyne 3 (1.2 mmol) was added. The RB was placed in an oil bath set at 75°C and was allowed to stir overnight. The reaction mixture was allowed to cool to room temperature and was purified by silica gel column chromatography to provide the propargylamine as pale yellow oil. It was then dissolved in 5 ml of ethanol and added SnCl₂·2H₂O (4.0 mmol) then heated at 70°C for 2h. After the completion of reaction it was filtered through celite by washing with ethylacetate and added water (50 ml) extracted with same solvent (2x20 ml). The combined organic layer washed with saturated NaOH and brine solution and dried over anhydrous Na₂SO₄ and concentrated under reduced pressure. The crude material was purified by column chromatography on silica gel using petroleum ether/ethyl acetate (5-20%) to afford quinoline in 40-50% yield.
