Supporting Information : 4 Pages including 3 Figures and 1 Table
Preparation of colloidal graphene oxide suspensions. Colloidal graphene oxide suspension was synthesized by using modified Hummer method. In a typical procedure, 4.00 g potassium permanganate (KMnO₄) and 23ml concentrated sulfuric acid (H₂SO₄) were added to a mixture of 1.00 g graphite flakes and 0.50 g NaNO₃ to oxidize the graphite layers under vigorous stirring in ice-water bath. The suspension was kept below 5°C for 60 min and at 35°C for 30min. And then 50ml of deionized water was slowly added to dilute the suspension with the temperature controlled below 50°C. After the diluted suspension was kept at 100 °C for 20 min, 100ml of deionized water was added under continuous stirring to obtain brownish suspension. To eliminate the superfluous KMnO₄, the proper amount of 30 wt% H₂O₂ was added into the suspension under continuous stirring until the color of the suspension varied from brown to bright yellow.

After repeating such purification processes as rinse with deionized water, centrifugal separation and ultrasonic dispersion, the suspension was loaded into dialysis bag and dialyzed in deionized water until the solution was neutral, and thus the stock suspension of GO was obtained, whose concentration was determined by gravimetric method. The GO suspensions for ion adsorption were prepared by diluting with deionized water according to the experimental requirements.
Fig. S1. Simulation of Langmuir and Freundlich isotherm adsorption models of Y(III) on GO nanosheets at 303K.

Fig. S2. Linear plots of $\ln K_d$ versus $C_e$ for Y(III) adsorption on graphene oxide nanosheets at 303K, 323K and 343 K. $[Y(III)]_0=12$ μg/ml, $V[Y(III)]_0=25$ ml, $V_{GO}=10$ ml, $C_{GO}=0.1$ mg/ml, pH=5.9± 0.1.
Fig.S3. Linear plots of ln $K_d$ versus $1/T$ for Y(III) adsorption on graphene oxide nanosheets at 303K, 323K and 343 K. $C[Y(III)]_0=12 \mu g/ml$, $V[Y(III)]_0=25 ml$, $V_{GO}=10 ml$, $C_{GO}=0.1 mg/ml$, pH=5.9±0.1.
