**Materials**

Methanol, dichloromethane, pyridine, triethylamine, were purified and dried before use. The n-hexane used was the fraction distilling between 40–60 ºC. All the chemicals including acryloyl chloride were procured from either Aldrich or Fluka. DMEM cell culture medium, Penicillin and Streptomycin were purchased from HiMedia, Mumbai, India. Fetal Bovine Serum (FBS) was procured from Invitrogen BioServices India Pvt. Ltd. MTT was from Sigma Aldrich. Water, with conductivity 0.6 μS cm\(^{-1}\), from Millipore Milli-Q system, was used for the preparation of aqueous solutions.

**Methods**

The melting points were recorded with a Thomas Hoover Capillary melting point apparatus and are uncorrected. The IR spectra were recorded using diamond single reflectance ATR in IR Affinity-1 spectrometer. The samples were analyzed over the range of 400-4000 cm\(^{-1}\), operating at 4 cm\(^{-1}\) resolution. The \(^1\)H (200 MHz, 600 MHz, 700 MHz) and \(^13\)C (50 MHz, 126 MHz, 176 MHz) NMR spectra were recorded with a Brüker Oxford instrument in CDCl\(_3\), CD\(_3\)OD or D\(_2\)O as solvents. The elemental analysis was carried out with a Thermo-Electron Corporation CHNS analyzer model Flash-EA 1112. The optical rotations were measured using a Jasco P1020 polarimeter. Mass of the materials was carried out with a MS (70 eV). The thin layer chromatography was performed on pre-coated plates (0.25 mm, silica gel 60 F254), and the spots were visualized by UV light or by spraying with 3.5% solution of 2,4-dinitrophenylhydrazine in ethanol/H\(_2\)SO\(_4\) or with basic aqueous KMnO\(_4\) solution followed by heating. A Co-60 gamma radiation source was used with a dose rate of 1.23 K Gy/h. Irradiation was carried out in 1 cm x 1 cm closed glass vials in nitrogen atmosphere.

3-Azido-3-deoxy-5-hydroxy-1,2-O-isopropylidene-6-O-tosyl-α-D-gluco-furanose (4).

To a stirred solution of the azido diol 3 (3.50 g, 14.27 mmol) and pyridine (1.38 mL, 17.12 mmol) in CH₂Cl₂ (50 mL), at 0 °C was added tosyl chloride (2.91 g, 15.27 mmol) dissolved in CH₂Cl₂ (15 mL) dropwise and DMAP (0.08 g, 0.71 mmol). The reaction mixture was stirred at same temperature for 1 h, slowly brought to 25 ºC and stirred for additional 2 h. After completion of reaction (cf. TLC), water (50 mL) was added and extracted with EtOAc (100 mL). The organic layer was washed, sequentially, with cold 1N HCl (2 x 20 mL), saturated NaHCO₃ (1 x 20 mL), brine (1 x 20 mL), water (1 x 50 mL), and dried over Na₂SO₄. Filtration and evaporation in vacuo gave a residue, which on column chromatography afforded 4 (4.96 g, 87%) as a thick liquid: Rₚ = 0.48 (30% EtOAc/hexane); [α]²⁵D = -7.27 (c 1.1, CHCl₃); vₘₐₓ/cm⁻¹ 1176, 1367; δH (600 MHz; CDCl₃) 7.81 (d, J = 8.2 Hz, 2H), 7.36 (d, J = 8.2 Hz, 2H), 5.81 (d, J = 3.4 Hz, 1H), 4.61 (d, J = 3.4 Hz, 1H), 4.31 (d, J = 8.8 Hz, 1H), 4.17 (s, 1H), 4.11 – 4.07 (m, 3H), 2.74 (d, J = 3.7 Hz, 1H, exchangeable with D₂O), 2.46 (s, 3H), 1.47 (s, 3H), 1.31 (s, 3H); δC (50 MHz; CDCl₃) 145.8, 132.9, 130.7, 128.7, 113.1, 105.6, 83.8, 78.1, 73.1, 68.2, 66.8, 27.2, 26.9, 22.3. A pre-cooled solution of TFA-H$_2$O (3:2, 10 mL) was added dropwise to RB charged with acrylamide (12) (1.30 g, 4.75 mmol) at 0 °C. The reaction mixture was stirred at same temperature for 30 min, slowly brought to 25 °C and was stirred for additional 10 h. After completion of reaction (cf. $\text{In vitro cell cytotoxicity test}$
The cell lines INT407 (human intestinal epithelial cell line) and L929 (mouse fibroblast cell line) were obtained from National Centre for Cell Sciences (NCCS), Pune, India. The cells were grown in DMEM medium with 10% fetal bovine serum, penicillin (100 U/mL) and streptomycin (100 µg/mL). Both the qualitative and quantitative in vitro cytotoxicity studies towards the test samples, were performed, respectively by microscopically observing the growth of the cells and by MTT, (3-[4,5-dimethylthiazol-2-yl]-2,5 diphenyl tetrazolium bromide) assay. In the former 15,000 cells were plated per well in a 24 well plate and allowed to adhere overnight. The test samples Glc-acryl, Glc-bis and Glc-gel (obtained directly after gamma irradiation) were added to the appropriate wells next day. Photograph of the cells were taken at regular intervals employing an inverted microscope with an attached camera (Leica EC3 type, Switzerland) at 40 × magnification. In the MTT assay the procedure mentioned above was followed and at the end of 48 h of incubation with the test samples, the number of viable cells in each well was quantified by incubation with MTT (0.5 mg/mL) for 4 h, followed by solubilisation buffer (10% SDS in 0.01N HCl) overnight. The plate was read in a plate reader at 550 nm. In both the experiments the samples were in triplicates and each experiment was conducted twice.
