General Procedure

Proton (1H) and carbon (13C) NMR spectra were obtained on a Varian Mercury 400 (400/100 MHz) spectrometer. Chemical shifts are reported in ppm units with Me₄Si or CHCl₃ as the internal standard. All reactions were routinely carried out under an inert atmosphere of dry nitrogen. Reactions were checked by thin layer chromatography (Kieselgel 60 F254, Merck). Spots were detected by viewing under a UV light, and by colorizing with charring after dipping in anisaldehyde solution in a mixture of acetic acid, sulfuric acid, and methanol. In aqueous work-up, all organic solutions were dried over anhydrous sodium sulfate and filtered prior to rotary evaporation. The crude compounds were purified by column chromatography on a silica gel (Kieselgel 60, 70-230 mesh, Merck). Unless otherwise noted, materials and all solvents were obtained from commercial suppliers and were used without purification. THF was freshly distilled from sodium and benzophenone.

Two-Step Synthesis of Hydroxy TMS-Furan 4

Hydroxyfuran 6. To a cooled (–78 °C) solution of furan (1.90 mL = 1.782 g, 26.2 mmol) in THF (50 mL) was added dropwise n-BuLi (11.0 mL, 2.5 M in hexane, 27.5 mmol). The resulting mixture was stirred for 1 h at 0 °C before (±)-1,2-epoxyoctane (2 mL = 1.678 g, 13.1 mmol) and HMPA (5 mL, 28.7 mmol) were added. After stirred for 24 h at room temperature, the reaction mixture was quenched with saturated aqueous NH₄Cl and diluted with Et₂O. The layers were separated, and the aqueous layer was extracted.

The resulting mixture was stirred for 2 h at the same temperature before TMSCl (5.7 mL, 44.9 mmol) was added dropwise. After stirred for 2 h at –30 ºC, the reaction mixture was quenched with saturated aqueous NH₄Cl and acidified with 1 N HCl. The resulting mixture was stirred for 5 h at room temperature and diluted with Et₂O. The layers were separated, and the aqueous layer was extracted with Et₂O. One-Pot Preparation of Hydroxy TMS-Furan 4.

To a cooled (−78 °C) solution of furan (1.90 mL = 1.782 g, 26.2 mmol) in THF (50 mL) was added dropwise $n$-BuLi (11 mL, 2.5 M in hexane, 27.5 mmol), and the resulting mixture was stirred for 1 h at 0 °C before (±)-1,2-epoxyoctane (2 mL = 1.678 g, 13.1 mmol) and HMPA (5 mL, 28.7 mmol) were added. After stirred for 24 h at room temperature, the reaction mixture was cooled to −78 °C, and $n$-BuLi (6.0 mL, 2.5 M in hexane, 15.0 mmol) was added dropwise.
