The solution of Boc$_2$O (2.18 g, 10 mmol) in CH$_3$OH (10 mL) was added dropwise to a solution of triethylamine (4.5 mL, 31 mmol ) and cystamine dihydrochloride (2.25 g, 10 mmol ) in CH$_3$OH (25 mL) in 20 minutes. The reaction mixture was stirred at room temperature for 5 h, and then the solvent was evaporated. The residue was dissolved in 25 mL KH$_2$PO$_4$ (1 mol/L) to make pH 4.27, then washed by ether (3×30 mL). The water phase was regulated with NaOH aqueous (1 mol/L) until the pH reached 9, and then extracted with ethyl acetate (3×30 mL). The organic layer was combined and dried over anhydrous sodium sulfate. After the filtration and evaporation, a yellow oily liquid was obtained (951mg, yield 38 %).
