EXPERIMENTAL SECTION

Materials

All reagents and chemicals were purchased from commercial suppliers. N, N-dimethylformamide (DMF), 1,2-dichroloethane and tetrahydrofuran (THF) were distilled with CaH₂, while acetonitrile was distilled with P₂O₅. Other chemicals and reagents were used as received without further purifications.

Fabrication of DSSCs

The dye-sensitized solar cells (DSSCs) devices were fabricated with working electrodes based on TiO₂ nanoparticles (NP) and Pt-coated counter electrodes reported elsewhere. For the working electrode, a paste composed of P25 TiO₂...
nanoparticles prepared with a sol-gel method\textsuperscript{62} for the transparent nanocrystalline layer was coated on a TiCl\textsubscript{4}-treated FTO glass substrate to obtain the required thickness on repetitive screen printing. Crystallization of TiO\textsubscript{2} films was performed with a programmed procedure: (1) heating at 275 °C for 5 min; (2) heating at 325 °C for 5 min; (3) heating at 375 °C for 5 min; (4) heating at 450 °C for 15 min and (5) heating at 500 °C for 15 min. The resulting layer had a transparent layer (thickness ~ 10 μm), which were treated again with TiCl\textsubscript{4} at 70 °C for 30 min and sintered at 500 °C for 30 min. After that, they were immersed in a 20 mM CDCA bath in ethanol solution for 8 h and then in a 3×10\textsuperscript{-4} M dye bath in CH\textsubscript{2}Cl\textsubscript{2} solution for 16 h at room temperature. The electrode was then rinsed with CH\textsubscript{2}Cl\textsubscript{2} and dried. To prepare the counter electrode, the Pt counter electrodes were prepared on spin-coating drops of H\textsubscript{2}PtCl\textsubscript{6} solution onto FTO glass and heating at 500 °C for 15 min. The dye-adsorbed TiO\textsubscript{2} electrodes and the Pt counter electrodes were assembled into a sealed sandwich-type cell by heating with a Surlyn film as a spacer between the electrodes. A drop of the electrolyte solution was placed in the drilled hole of the counter electrode and was driven into the cell via vacuum backfilling. Finally, the hole was sealed using additional Surlyn and a cover glass (0.1 mm thickness). The electrolyte introduced into the cell is composed of 0.6 M 1,3-dimethylimidazolium iodide (DMII), 50 mM LiI, 30 mM I\textsubscript{2}, 0.5 M tert-butylpyridine and 0.1 M guanidinium thiocyanate (GuNCS) in a solvent mixture of 85% acetonitrile with 15% valeronitrile by volume.\textsuperscript{53} An Al foil was taped at the back side of each counter electrode to reflect unabsorbed light back to the photoanode. DSSCs based on single dye with soaked 16 h and 32 h are similar to the frond of the method, while those soaked 16+16 h need to soak twice according to the above method.

**Instrumentation**

The molecular structures of TTR1-3 and intermediates were confirmed by \textsuperscript{1}H NMR, \textsuperscript{13}C NMR, and mass spectra, as summarized in the supporting materials. The attenuated total reflection fourier transform infrared (ATR-FTIR) spectra were measured with a Thermo Scientific Nicolet iS10 FT-IR Spectrometer. The \textsuperscript{1}H NMR
and $^{13}$C NMR spectra were recorded in solution of CDCl$_3$ or DMSO-$d_6$ on a Bruker DRX (500 MHz) NMR spectrometer with tetramethylsilane (TMS) as the internal standard. MALDI-TOF (matrix-assisted laser desorption ionization time-of-flight) analysis was performed on Bruker Daltonics Ultraflex MALDI TOF/TOF Mass Spectrometer, using $\alpha$-Cyano-4-hydroxycinnamic acid as matrix. Electron spray mass spectrometry was measured in Thermo LCQ Fleet Electro-Spray Mass Spectrometer.

When the mixture was cooled to 0 °C, a solution of t-BuCl (6.6 mL, 0.06 mol) in CH$_2$Cl$_2$ (20 mL) was added slowly. After that, the ice-bath was removed and the resulting mixture was stirred for 24 h at room temperature. Then, the mixture was poured into water, extracted with CH$_2$Cl$_2$ (3 × 50 mL), and dried with anhydrous MgSO$_4$. Solvent was evaporated to afford the crude products, which were recrystallized from petroleum ether twice to give compound 1 as a white solid (4.5 g, yield 54%). $^1$H-NMR (DMSO, 500 MHz): δ 10.90 (s, 1H), 8.14 (s, 2H), 7.43 (d, $J = 10.5$, 2H), 7.36 (d, $J = 10.5$, 2H), 1.41 (s, 18H).
