General Remarks.

$^1$H and $^{13}$C NMR spectra were recorded on 300 MHz instrument. The $^1$H chemical shifts are reported in ppm relative to tetramethylsilane. High–resolution mass spectra were recorded by using ion source temperature 150–250°C as required. High–resolution EI–mass spectra were performed with a resolution of 10000. For thin layer chromatography, analytical TLC plates SIL G/UV254 and 70–230 mesh silica gel were used. Reagents were used without further purification. Solvents like water, heptane and ethyl acetate were used after distillation.

Microwave Irradiation Experiments.

All microwave irradiation experiments were carried out in a dedicated CEM–Discover monomode microwave apparatus, operating at a frequency of 2.45GHz with continuous irradiation power from 0 to 100 W with utilization of the standard absorbance level of 100 W maximum power. The reactions were carried out in 10 mL glass tubes, sealed with Teflon septum and placed in the microwave cavity. The reaction was irradiated at a required ceiling temperature using maximum power for the stipulated time. Then it was cooled to ambient temperature with gas jet cooling.

General Procedure for the Preparation of Alkylsubstituted Propargylamines.

To a microwave vial equipped with magnetic stir bar was added amine (2.6 or 3.0 mmol), aldehyde (2.0 mmol), acetylene (3.2 mmol), CuCl (0.2 mmol), CuCl$_2$ (0.2 mmol) and water (3.0 mL). The microwave vial was flushed with argon. The reaction vessel was then sealed and irradiated in a cavity of CEM–Discover microwave reactor at 100 W for 25 min at a ceiling temperature of 110°C. The resulting reaction mixture was extracted with EtOAc (20mL). Organic phase was dried over anhydrous Na$_2$SO$_4$ and the solvent was removed under reduced pressure. The residue was then loaded directly onto a column and flashed on silica gel (10–15% EtOAc in heptane) to afford the product as a yellowish oil. The identity and purity of the products were confirmed by $^1$H, $^{13}$C NMR, and HRMS.
