Experimental

General procedures
All chemicals were purchased as reagent grade and used without further purification. Solvents were dried according to standard methods. MuNANA (2’-(4-methylumbelliferyl)-α-D-N-acetyleneuraminic acid sodium salt), used as a donor substrate for sialylation reactions, was acquired from Toronto Research Chemicals Inc. The trans-sialidase used in this study was a His-tagged 70 kDa recombinant material truncated to remove C-terminal repeats but retaining the catalytic N-terminal domain of the enzyme.1 Reactions were monitored by thin layer chromatography (TLC) on 0.25 mm precoated silica gel plates (Whatman, AL SIL G/UV, aluminium backing) with the indicated eluents. Compounds were visualized under UV light (254 nm) and/or dipping in ethanol–sulfuric acid (95:5, v/v) or orcinol (2%) in aqueous sulfuric acid (10%), followed by heating the plate for a few minutes. Column chromatography was performed on silica gel 60 (Fluorochem, 35–70 mesh) or on a Biotage Horizon High-Performance FLASH Chromatography system using 12 mm or 25 mm flash cartridges with the eluents indicated. The microwave-assisted reactions were carried out in a Biotage Initiator System, using sealed tubes. HPLC purifications were performed in the Dionex DX-500 HPLC system using a Phenomenex C18 semi-preparative reverse phase column (250 x 10.0 mm). Nuclear magnetic resonance spectra were recorded on a JEOL Lambda 400MHz spectrometer. 1H-NMR spectra recorded at 400MHz were referenced to δH 7.27 for CDCl3, δH 3.35 for CD3OD, δH 4.63 ppm for D2O, and 13C NMR spectra recorded at 100 MHz were referenced to δC 77.0 for CDCl3 and δC 49.15 for CD3OD. Assignments were made with the aid of HSQC and COSY experiments. Optical rotations were measured at ambient temperature on a Perkin-Elmer model 341 polarimeter using a sodium lamp. Accurate mass electrospray ionization mass spectra (ESI-MS) and high resolution ESI-MS (HRESI MS) were obtained from the John Innes Centre metabolite analysis service on a Thermo Finningan DecaXPplus using positive or negative ionization mode, and Thermofisher LTQ Orbitrap XL mass spectrometers, respectively.

Molecular modelling procedure
A conformational search was performed for cyclic pseudotrisaccharides 15 and 19 using the MONTE CARLO method, using the MMFF molecular mechanics model implemented in the Spartan’06 1.1.2 software2 using non-solvated conditions (gas phase). For initial modelling of glycomacrocycle 15 the crystallographic data for 4-(β-D-glucopyranosyl)-1-methoxycarbonylmethyl-triazole3 was used as a basis to build the input structure. On the other hand, no crystallographic structure has been reported for the
galactose methylene triazole moiety of glycomacrocycle 19, and thus, a simple input 3D structure was built from the 2D structure, and then energy minimized. Once relaxed the macrocyclic structures of the two glycopolymers were subjected to a conformational search and the lowest energy conformers for each compound was selected from among 10,000 conformations analyzed by the MONTE CARLO method. Sets of six superimposed lowest energy conformations of 15 and 19 are presented in Fig S20.
