I. General Information. 1H and 13C NMR spectra were recorded on either a Varian INOVA 500 FT-NMR (499.6 MHz for 1H, 125.6 MHz for 13C) or a Varian Mercury 400 FT-NMR spectrometer (400.6 MHz for 1H, 100.7 MHz for 13C). 1H NMR data are reported as follows: chemical shift (multiplicity (br s = broad singlet, s = singlet, d = doublet, t = triplet, q = quartet, and m = multiplet), coupling constant and integration). 1H and 13C chemical shifts are reported in ppm downfield from tetramethylsilane (TMS, δ scale) using the residual solvent resonances as internal standards. 31P NMR spectra were recorded on a Varian INOVA 400 FTNMR spectrometer (161.9 MHz for 31P) and externally referenced to 85% phosphoric acid solution in D2O.

Analytical gel-permeation chromatography (GPC) was carried out on a Varian ProStar HPLC system (Varian Inc., USA) equipped with a multi-wavelength detector using a Phenomenex Phenogel 100-Å column packed in CH2Cl2 with a 7.80-mm inner diameter and a 300-mm length. Samples were eluted using CH2Cl2 (flow rate = 1 mL/min) and monitored at 440 nm.
Matrix-assisted laser desorption ionization time-of-flight (MALDI-ToF) mass spectra were recorded on a Bruker Autoflex III MALDI spectrometer using either reflective positive or linear negative ionization method with either anthracene or dithranol matrices. The use of non-acidic anthracene matrix is critical for porphyrin containing Al-OME: if the acidic 2-hydroxy-1-naphthoic acid matrix is used, extensive demetallation occurs. When the slightly less acidic matrix dithranol was used, demetallation was not observed but significant loss of the OMe axial ligand does occur and µ-oxo dimer can often be observed. High-resolution electrospray ionization mass spectrometric (HRESIMS) data were obtained by staff members in the Integrated Molecular Structure Education and Research Center (IMSERC), Northwestern University (Evanston, IL, USA).

UV-vis spectra were obtained in CH₂Cl₂ or CHCl₃ on a Varian Cary 500 spectrophotometer unless otherwise noted. Fluorescence emission spectra were obtained in a mixture of CHCl₃/MeOH (1:1 v/v) on a Jobin Yvon FluoroLog fluorometer (λₑx = 442 nm, λₑm = 500 – 800 nm, slit width = 3 nm) (HORIBA Jobin Yvon Inc., Edison, NJ, USA). Dynamic light-scattering (DLS) measurements were performed on a Zetasizer Nano ZS (Malvern Instruments, Malvern, UK) with a He-Ne laser (633 nm). Non-invasive backscatter method (detection at 173° scattering angle) was used.

II. General procedures and materials. All air- or water-sensitive reactions were carried out under nitrogen using oven-dried glassware. All synthetic and catalytic experiments concerning porphyrin and porphyrin derivatives were carried out under light-deficient conditions: the hood lights were turned off and the reaction flasks are covered with aluminum foil to further minimize light exposure. Isolated porphyrin products were stored at low temperatures (-10 °C) in foil-covered vials. All flash-chromatography was carried out using silica gel (MP Silitech 60-200 mesh) under a positive pressure of nitrogen, unless otherwise noted. Analytical thin layer chromatography (TLC) was performed using glass-backed silica gel 60 F₂₅₄ plates (Merck EMD-571507). Visualization of the TLC results was achieved either by observation under UV light (254 nm), or via treatment with 10 wt% phosphomolybdic acid in ethanol followed by heating.

Tetrahydrofuran and dichloromethane (Fisher Scientific) were dried over neutral alumina in a Dow-Grubbs solvent system installed by Glass Contours (now SG Water, Nashua, NH, USA). All other reagents and solvents were purchased from the Aldrich Chemical Company (Milwaukee, WI, USA) and used without further purification. Deuterated solvents were purchased from Cambridge Isotope Laboratories (Andover, MA, USA) and used without further purification.

III. Preparation of the template porphyrin Py-MesP.

2,5-Dibromo-1,3-dimethylbenzene (1). This compound was synthesized following a modified literature procedure. Into a 500 mL round-bottom flask equipped with a magnetic stir bar was added conc. sulfuric acid (70
mL). The flask was cooled down in an ice bath while stirring and NaNO₂ (6.9 g, 0.10 mol) was added. After 30 min, a solution of 4-bromo-2,6-dimethylaniline (20 g, 0.10 mol) in glacial acetic acid (80 mL) was slowly added to the reaction solution. This mixture was allowed to stir at 0 °C for 1 h before additional glacial acetic acid (50 mL) was added. The resulting suspension was then poured into a mixture of copper(I) bromide (17.2 g, 0.12 mol) and 48 wt% hydrobromic acid (70 mL). The combined mixture was allowed to warm to 70 °C and vigorously stirred for 2 h. The resulting mixture was diluted with ice water (200 mL) and extracted with hexanes (3 × 150 mL). The combined organic extracts were dried over MgSO₄, filtered, and concentrated under reduced pressure. Purification via silica gel column chromatography (column dimensions = 60 mm × 250 mm, hexanes eluent) afforded 12.7 g (48% yield, 0.048 mol) of 1 as a colorless oil. Spectroscopic data for 1 was in good agreement with literature data.¹ Rf = 0.62 (hexanes). ¹H NMR (499.6 MHz, CDCl₃): δ 2.38 (s, 6H, CH₃), 7.21 (s, 2H, Ar-H). ¹³C NMR (125.6 MHz, CDCl₃): δ 23.6 (CH₃), 120.2 (Cp), 126.3 (Ci), 130.8 (Cm), 140.2 (Co).

4-Bromo-3,5-dimethylbenzaldehyde (2). This compound was synthesized following a modified literature procedure.¹ In a 100 mL round-bottom flask equipped with a magnetic stir bar, a solution of compound 1 (4.0 g, 15.1 mmol) in anhydrous Et₂O (50 mL) was allowed to cool to -78 °C under N₂ before 4BuLi (9.4 mL of a 1.6 M solution in hexanes, 1.0 equiv) was added dropwise. After stirring for 1 h under N₂ at -78 °C, N,N-dimethylformamide (3.6 mL, 46.9 mmol, 3.1 equiv) was added and the reaction mixture was allowed to warm to room temperature. It was then acidified with 5 wt% HCl solution (10 mL) and extracted with diethyl ether (3 × 80 mL). The combined organic extracts were dried over MgSO₄, filtered, and concentrated under reduced pressure. Purification via silica gel column chromatography (column dimensions = 60 mm × 250 mm, eluent = EtOAc/hexanes 1:6 v/v) afforded 2.6 g (81% yield, 12.2 mmol) of 2 as colorless crystals. Spectroscopic data for 2 was in good agreement with literature data.¹ Rf = 0.34 (EtOAc/hexanes = 1:6 v/v). ¹H NMR (499.6 MHz, CDCl₃): δ 2.47 (s, 6H, CH₃), 7.54 (s, 2H, Ar-H), 9.91 (s, 1H, CHO). ¹³C NMR (125.6 MHz, CDCl₃): δ 24.1 (CH₃), 129.0 (C₆), 132.7 (C₇), 134.8 (C₈), 139.7 (C₉), 191.9 (CHO).

3,5-dimethyl-4-(4'-pyridyl)benzaldehyde (3). A 250 mL two-necked flask, equipped with a septum inlet and a reflux condenser, was degassed with N₂ and then charged with compound 2 (2.35 g, 11.0 mmol), Cs₂CO₃ (4.3 g, 13.2 mmol), and Pd(PPh₃)₄ (1.0 g, 0.87 mmol). A degassed solution of 4-pyridineboronic acid pinacol ester (2.7 g, 13.1 mmol) in THF (130 mL) was added rapidly through the septum inlet with a syringe. The mixture was heated to 80 °C for 12 h under stirring, cooled down to room temperature, and then poured into water (100 mL). The
resulting mixture was extracted with EtOAc (3 × 120 mL). The combined organic extracts were dried over MgSO₄, filtered, and concentrated under reduced pressure. Purification via silica gel column chromatography (column dimensions = 40 mm × 300 mm, eluent = EtOAc/hexanes 1:1 v/v) afforded 2.0 g (86% yield, 9.5 mmol) of 3 as a pale yellow solid. Rₛ = 0.35 (EtOAc/hexanes = 1:1 v/v). ¹H NMR (499.6 MHz, CDCl₃): δ 2.10 (s, 6H, CH₃), 7.10 (d, J = 5.5 Hz, 2H, pyridyl CH), 7.64 (s, 2H, Ar-H), 8.73 (d, J = 5.5 Hz, 2H, pyridyl CH), 10.01 (s, 1H, CHO). ¹³C NMR (125.6 MHz, CDCl₃): δ 20.8 (CH₃), 123.8 (pyridyl Cm), 129.1 (Ar-Cₔ), 136.0 (Ar-Cₐ), 136.7 (Ar-Cm), 145.3 (Ar-Cp), 148.5 (pyridyl Cp), 150.6 (pyridyl Cₐ), 192.4 (CHO). HRESIMS: Calcd for [C₁₄H₁₃NO+H]⁺: 212.1075, found: m/z 212.1081 [M+H]⁺.

Fig. S1 The ¹H (top) and ¹³C NMR (bottom) spectra for 3,5-dimethyl-4-(4'-pyridyl)benzaldehyde (3).

[5,10,15,20-Tetrakis(4-(4'-pyridyl)-3,5-(dimethyl)phenyl)porphine (Py-MesP).] In a 100 mL round-bottom flask equipped with a magnetic stir bar, freshly distilled pyrrole (0.41 mL, 5.92 mmol) was added dropwise to a solution of compound 3 (1.25 g, 5.92 mmol) in propionic acid (24 mL). The reaction mixture was refluxed for 2 h under N₂ and then cooled down to room temperature. Excess propionic acid was removed by vacuum distillation at 60 °C and 20 mm Hg. The resulting black residue was dissolved in dichloromethane (100 mL) and washed with saturated aqueous Na₂CO₃ (30 mL). The remaining organic layer was dried over MgSO₄, filtered, and concentrated under reduced pressure. Purification via silica gel column chromatography (column dimensions = 40 mm × 300 mm, eluent = MeOH/CH₂Cl₂ 1:15 v/v) afforded 562 mg (9.2% yield, 0.54 mmol) of Py-MesP as a purple solid. Rₛ
= 0.25 (MeOH/CH2Cl2 = 1:15 v/v). 1H NMR (499.6 MHz, CDCl3): δ -2.69 (s, 2H, NH), 2.35 (s, 24H, CH3), 7.50 (d, J = 5.0 Hz, 8H, β-pyridyl-H), 8.04 (s, 8H, Ar-H), 8.87 (d, J = 4.5 Hz, 8H, α-pyridyl-H), 9.03 (s, 8H, β-H). 13C NMR (125.6 MHz, CDCl3): δ 21.1 (CH3), 120.2 (C1), 125.0 (pyridyl-Cm), 133.7 (C5, Ar-Ci), 134.5 (C4, Ar-Co), 138.7 (Ar-Cm), 141.9 (Ar-Cp), 149.6 (pyridyl-Cp), 150.5 (pyridyl-Co). MALDI-ToF (reflective positive mode): Calcd for C72H58N8: 1034.47, found: m/z 1034.07 [M]+. UV-vis (nm, (ε ×10^4 /M·cm^-1)): 420 (22.7), 516 (0.9), 553 (0.5), 590 (0.3), 648 (0.3).

Fig. S2 The 1H (top) and 13C NMR (bottom) spectra for [5,10,15,20-tetrakis(4-(4´-pyridyl)-3,5-(dimethyl)phenyl)]porphine (Py-MesP).

IV. Preparation of porphyrins possessing pentenyloxyphenyl substituents.

4-(1-Pentenyloxy)benzaldehyde (4). This compound was synthesized following a modified literature procedure. Into a 250 mL round bottom flask equipped with a magnetic stir bar and a water-cooled reflux condenser were combined 4-hydroxybenzaldehyde (5.0 g, 40.9 mmol), K2CO3 (11.9 g, 86.1 mmol), anhydrous acetonitrile (150 mL), and 5-bromo-1-pentene (9.1 g, 61.1 mmol). The resulting mixture was then refluxed for 4 h under N2. The solution was cooled to room temperature, filtered, and washed with dichloromethane (3 × 50 mL). The combined organics were evaporated to dryness under reduced pressure. The resultant residue was dissolved in dichloromethane (150 mL) and washed with water (50 mL). Organic layer was dried over MgSO4, filtered, and concentrated under reduced pressure. Purification via silica gel chromatography (column dimensions = 60 mm × 250 mm, eluent = EtOAc/hexanes 1:3 v/v) afforded 7.5 g (97% yield, 39.7 mmol) of 4 as a pale yellow oil. Spectroscopic data for 4 was in good agreement with literature data. Rf = 0.50 (EtOAc/hexanes = 1:3 v/v). 1H NMR (499.6 MHz, CDCl3): δ 1.93 (m, 2H, CH2=CH2), 2.26 (dd, J1 = 13.5 Hz, J2 = 6.5 Hz, 2H, CH2=CHCH2),
4.06 (t, J = 6.5 Hz, 2H, CH₂CH₂O), 5.03 (dd, J₁ = 25.5 Hz, J₂ = 10.0 Hz, 1H, CH₂=CHCH₂), 5.08 (dd, J₁ = 25.5 Hz, J₂ = 17.0 Hz, 1H, CH₂=CHCH₂), 5.86 (m, 1H, CH₂=CHCH₂), 6.99 (d, J = 8.0 Hz, 2H, Ar-H), 7.83 (d, J = 8.5 Hz, 2H, Ar-H), 9.88 (s, 1H, CHO). ¹H NMR (125.6 MHz, CDCl₃): δ 28.3 (CH₂CH₂O), 30.1 (CH₂=CHCH₂), 67.7 (CH₂=CHCH₂), 114.9 (Ar-Co), 115.6 (CH₂=CHCH₂), 129.9 (Ar-Cp), 132.1 (Ar-Cm), 137.6 (CH₂=CHCH₂), 138.6 (CH₂=CHCH₂), 158.6 (Ar-Ci).

(4-(1-Pentenyl)oxy)phenyl)dipyrromethane (5). Compound 4 (3.0 g, 15.8 mmol) was combined with freshly distilled pyrrole (110 mL) in a 200 mL Schlenk flask equipped with a magnetic stir bar. This mixture was degassed for 20 min with a stream of N₂. Solid InCl₃ (349 mg, 1.58 mmol) was then added in one portion, and the reaction mixture was stirred under N₂ at room temperature. After 2 h, solid NaOH (1.9 g, 47.5 mmol) was added to quench the reaction, followed by additional stirring for 1h at room temperature. The reaction mixture was filtered and evaporated to dryness by rotary evaporation. Excess pyrrole was removed by vacuum distillation at 60 °C and 20 mm Hg. The resulting residue was then subjected to silica gel column chromatography (column dimensions = 60 mm × 250 mm, eluent = hexanes/CH₂Cl₂/EtOAc 7:2:1 v/v/v) to yield the desired product as a yellow solid (3.1 g, 64%, 10.1 mmol). Spectroscopic data for 5 was in good agreement with literature data. Rₖ = 0.38 (hexanes/CH₂Cl₂/EtOAc = 7:2:1 v/v/v). ¹H NMR (499.6 MHz, CD₂Cl₂): δ 1.88 (m, 2H, CH₂CH₂O), 2.24 (dd, J₁ = 14.0 Hz, J₂ = 7.0 Hz, 2H, CH₂=CHCH₂), 3.97 (t, J = 6.5 Hz, 2H, CH₂CH₂O), 5.01 (dd, J₁ = 34.2 Hz, J₂ = 10.0 Hz, 1H, CH₂=CHCH₂), 5.08 (dd, J₁ = 34.2 Hz, J₂ = 17.5 Hz, 1H, CH₂=CHCH₂), 5.39 (s, 1H, CH₂=CHCH₂), 5.87 (s, 2H, pyrrole CH), 5.91 (m, 1H, CH₂=CHCH₂), 6.12 (d, J = 3.0 Hz, 2H, pyrrole CH), 6.67 (s, 2H, pyrrole CH), 6.86 (d, J = 8.5 Hz, 2H, Ar-H), 7.12 (d, J = 8.5 Hz, 2H, Ar-H), 7.98 (br s, 2H, NH). ¹¹C NMR (125.6 MHz, CD₂Cl₂): δ 29.0 (CH₂CH₂O), 30.6 (CH₂=CHCH₂), 43.7 (CH), 67.8 (CH₂CH₂O), 107.3 (pyrrole CH₂), 108.7 (pyrrole CH), 115.0 (Ar-C₆), 115.4 (CH₂=CHCH₂), 117.5 (pyrrole CH₂), 129.8 (Ar-C₆), 133.5 (Ar-Cm), 134.9 (pyrrole CH), 138.6 (CH₂=CHCH₂), 158.6 (Ar-Ci).

3-Trihexylsilyl-2-propyn-1-ol (6). This compound was synthesized following a modified literature procedure. In a 500 mL round-bottom flask equipped with a magnetic stir bar, a solution of propargyl alcohol (1.0 g, 17.8 mmol) in anhydrous THF (150 mL) was allowed to cool to -78 °C under N₂ before "BuLi (23.4 mL of a 1.6 M solution in hexanes, 2.1 equiv) was added dropwise. After stirring for 30 min at -78 °C under N₂, chlorotrihexylsilane (12.2 g, 38.3 mmol) was slowly added to the mixture. The reaction mixture was then allowed to warm to room temperature and stirred under N₂ for additional 3 h. It was then acidified with 2 M HCl solution (60 mL) and the reaction was stirred for 12 h at room temperature. The solution was extracted with Et₂O (3 × 150
mL) and the combined organic extracts were washed with saturated aqueous NaHCO₃ (100 mL) and brine (100 mL) before being dried over MgSO₄. Purification via silica gel column chromatography (column dimensions = 60 mm × 250 mm, eluent = EtOAc/hexanes 1:10 v/v) afforded 5.1 g (85%, 15.1 mmol) of 6 as a pale yellow oil. Rᵥ = 0.45 (EtOAc/hexanes = 1:8 v/v). ¹H NMR (499.6 MHz, CDCl₃): δ 0.60 (t, J = 9.0 Hz, 6H, CH₂Si), 0.88 (t, J = 7.0 Hz, 9H, CH₃), 1.30 (m, 24H, CH₂), 1.82 (s, 1H, OH), 4.26 (s, 2H, CH₂OH). ¹³C NMR (125.6 MHz, CDCl₃): δ 13.4 (CH₂Si), 14.3 (CH₃), 22.8 (CH₂), 23.9 (CH₂), 31.7 (CH₂), 33.3 (CH₂), 51.8 (CH₂OH), 89.0 (SiC≡C), 105.0 (SiC≡C).

3-Trihexylsilyl-2-propynal (7). In a 250 mL round-bottom flask equipped with a magnetic stir bar, a solution of compound 6 (3.8 g, 11.2 mmol) in CH₂Cl₂ (5 mL) was added dropwise at 0 °C to a suspension of pyridinium chlorochromate (4.8 g, 22.4 mmol) in CH₂Cl₂ (150 mL). After stirring for 9 h, the dark suspension was filtered through a pad of silica gel, which was then washed with CH₂Cl₂ (200 mL). The volatiles were evaporated from the filtrate using a rotary evaporator. Purification via silica gel column chromatography (column dimensions = 60 mm × 250 mm, eluent = EtOAc/hexanes 1:25 v/v) afforded 3.27 g (87%, 9.7 mmol) of 7 as a colorless oil. Spectroscopic data for 7 was in good agreement with literature data. Rᵥ = 0.45 (EtOAc/hexanes = 1:40 v/v). ¹H NMR (499.6 MHz, CDCl₃): δ 0.69 (t, J = 9.0 Hz, 6H, CH₂Si), 0.89 (t, J = 6.5 Hz, 9H, CH₃), 1.32 (m, 24H, CH₂), 9.18 (s, 1H, CHO). ¹³C NMR (125.6 MHz, CDCl₃): δ 12.7 (CH₂Si), 14.3 (CH₃), 22.8 (CH₂), 23.8 (CH₂), 31.6 (CH₂), 33.2 (CH₂), 102.5 (SiC≡C), 103.7 (SiC≡C), 176.8 (CHO).

[[5,15-Bis(4-(1-pentenyloxy)phenyl)-10,20-bis((trihexylsilyl)ethynyl)porphinato]zinc(II) (Zn-PP). In a 1 L Schlenk flask equipped with a magnetic stir bar were combined compound 5 (1.90 g, 6.2 mmol), 3-tri hexylsilyl-2-propynal 7 (2.09 g, 6.2 mmol), and CH₂Cl₂ (900 mL). The resulting mixture was degassed with a stream of N₂ for 10 min and cooled to 0 °C. After BF₃·Et₂O (0.15 mL) was added, the reaction mixture was stirred under N₂ for 30 min at 0 °C before being warmed up to room temperature. After stirring for an additional 30 min at room temperature, DDQ (2.81 g, 12.4 mmol) was added as a solid and stirring was continued for an additional 3 h. A solution of Zn(OAc)₂·2H₂O (2.04 g, 9.3 mmol) in MeOH (30 mL) was then added and the reaction mixture was allowed to stir for 12 h more before being evaporated to dryness using a rotary evaporator. The crude product was purified by silica gel column chromatography (column dimensions = 40 mm × 300 mm, eluent = THF/hexanes 1:15 v/v) to yield the desired product as a purple solid (1.83 g, 22%, 1.4 mmol). Rᵥ = 0.37 (THF/hexanes = 1:20 v/v).
NMR (499.6 MHz, CDCl3): $\delta$ 0.91 (t, $J = 7.0$ Hz, 18H, $^6$Hex CH$_3$), 1.03 (m, 12H, $^6$Hex CH$_2$), 1.35-1.44 (m, 24H, $^6$Hex CH$_2$), 1.55 (m, 12H, $^6$Hex CH$_2$), 1.77 (m, 12H, $^6$Hex CH$_2$), 2.13 (m, 4H, CH$_2$CH$_2$O), 2.45 (m, 4H, CH$_2$=CHCH$_2$), 4.30 (t, $J = 6.0$ Hz, 4H, CH$_2$CH$_2$O), 5.13 (dd, $J_1 = 44.5$ Hz, $J_2 = 10.5$ Hz, 2H, CH$_2$=CHCH$_2$), 5.22 (dd, $J_1 = 44.5$ Hz, $J_2 = 17.5$ Hz, 2H, CH$_2$=CHCH$_2$), 6.01 (m, 2H, CH$_2$=CHCH$_2$), 7.30 (d, $J = 8.5$ Hz, 4H, Ar-H), 8.09 (d, $J = 8.0$ Hz, 4H, Ar-H), 8.94 (d, $J = 4.5$ Hz, 4H, $\beta$-H$_2$), 9.70 (d, $J = 4.5$ Hz, 4H, $\beta$-H$_1$).

MALDI-ToF (reflective positive mode): Calcd for C$_{82}$H$_{112}$N$_4$O$_2$Si$_2$Zn: 1304.76, found: m/z 1304.72 [M]+. UV-vis (nm, (ε × 10$^4$ /M$^{-1}$cm$^{-1}$)): 436 (43.2), 538 (0.4), 577 (1.5), 625 (3.6).

**Fig. S3** The $^1$H (top) and $^{13}$C NMR (bottom) spectra for [[5,15-bis(4-(1-pentenyloxy)phenyl)-10,20-bis((trihexylsilyl)ethynyl)]porphinato]zinc(II) (Zn-PP).

[[5,15-Bis(4-(1-pentyloxy)phenyl)-10,20-bis((trihexylsilyl)ethynyl)]porphinato]aluminum(III) methoxide (MeO-AL-PP). To a magnetically stirred solution of Zn-PP (100 mg, 76.5 μmol) in CH$_2$Cl$_2$ (25 mL) in a 50 mL round bottom flask was added aqueous HCl (5 mL of an 18.5 wt% solution). After stirring for 15 min at room temperature, the resulting mixture was washed consecutively with water (40 mL), saturated aqueous NaHCO$_3$ (30 mL), and brine (30 mL) before being dried over Na$_2$SO$_4$ and filtered. The filtrate was then evaporated to dryness using a rotary evaporator and the remaining residue was subjected to silica gel column chromatography (column
dimensions = 20 mm × 200 mm, eluent = CH2Cl2/hexanes 1:2 v/v) to yield the demetallated product (PP) as a purple solid (88 mg, 92%, 70.7 μmol). Rf = 0.34 (CH2Cl2/hexanes = 1:3 v/v). 1H NMR (499.6 MHz, CDCl3): δ -2.12 (s, 2H, NH), 0.91 (t, J = 6.0 Hz, 18H, "Hex CH3), 1.02 (m, 12H, "Hex CH2), 1.35-1.45 (m, 24H, "Hex CH2), 1.54 (m, 12H, "Hex CH2), 1.77 (m, 12H, "Hex CH2), 2.13 (m, 4H, CH2=CHCH2), 2.45 (m, 4H, CH2=CHCH2), 4.30 (t, J = 6.0 Hz, 4H, CH2=CHCH2), 5.13 (dd, J1 = 44.2 Hz, J2 = 11.0 Hz, 2H, CH2=CHCH2), 5.22 (dd, J1 = 44.2 Hz, J2 = 16.5 Hz, 2H, CH2=CHCH2), 6.01 (m, 2H, CH2=CHCH2), 7.31 (d, J = 8.0 Hz, 4H, Ar-H), 8.85 (d, J = 5.0 Hz, 4H, β-H), 9.61 (d, J = 4.5 Hz, 4H, β-H). 13C NMR (125.6 MHz, CDCl3): δ 14.0 (C=Si), 14.4 (CH3), 22.9 (CH2), 24.6 (CH2), 28.9 (CH2=CH2), 30.5 (CH2=CHCH2), 31.9 (CH2), 33.6 (CH2), 67.8 (CH2=CH2), 101.2 (Si=C=C), 101.4 (Si=C=C), 108.2 (C=O), 113.2 (CH2=CHCH2), 115.6 (Ar-C), 121.8 (C), 133.8 (Ar-Cp and C), 135.8 (Ar-Cm and CH2=CHCH2), 138.1 (C; and C), 159.3 (Ar-Ci and C4). Fig. S5 The 1H (top) and 13C NMR (bottom) spectra for [[5,15-bis(4-(1-pentenyloxy)phenyl)-10,20-bis((trihexylsilyl)ethyl)phenyl]porphinato]aluminum(III) methoxide (MeO-Al-PP).

V. Preparation of covalently linked porphyrin molecular boxes.

Covalently linked Zn-molecular box incorporating Py-MesP template (Zn-PP)4(Py-MesP). Into a 250 mL Schlenk flask equipped with a magnetic stir bar were combined Zn-PP (100 mg, 76.5 μmol), anhydrous CH2Cl2 (150 mL), and the Py-MesP template (19.1 mg, 19.1 μmol). The resulting mixture was degassed with N2 for 10 min and then allowed to stir under N2 for an additional 20 min. A degassed CH2Cl2 (2 mL) solution of Grubbs’
second-generation catalyst (16.3 mg, 25 mol%) was then added via cannula to the reaction mixture and the resulting mixture was allowed to stir under N₂ for 14 h. A second catalyst aliquot (6.5 mg, 10 mol%, in 2 mL of N₂-degassed CH₂Cl₂) was then added via cannula and stirring was continued for 12 h more at room temperature.  (Note: without the additional catalyst, the primary product, as analyzed by MALDI-ToF MS, are dimers.) The reaction was then quenched by adding ethyl vinyl ether (15 mL) and opening to air. Solvents were removed from the quenched reaction mixture under reduced pressure using a rotary evaporator and the resulting residue was subjected to size-exclusion chromatography (column dimensions = 40 mm × 300 mm, Bio-Rad Bio-Beads S-X1, CH₂Cl₂ eluent). The molecular box was collected from a dark purple band, which was purified once again by silica gel column chromatography (column dimensions = 20 mm × 200 mm, eluent = CH₂Cl₂/hexanes 1:2 v/v) to afford (Zn-PP)₄(Py-MesP) as a purple solid (59 mg, 74% based on the recovered Zn-PP monomer (32 mg)). Rᵥ = 0.40 (CH₂Cl₂/hexanes = 1:2 v/v). ¹H NMR (499.6 MHz, CDCl₃): δ -3.39 (s, 2H, NH), 0.88 (m, 72H, n.Hex C₃H₃), 0.99 (m, 48H, n.Hex C₂H₂), 1.27-1.37 (m, 96H, n.Hex C₂H₂), 1.52 (m, 48H, n.Hex CH₂), 1.75 (m, 48H, n.Hex CH₂), 2.22 (m, 16H, CH₂CH₂O), 2.54 (m, 16H, CH=CHC₂H₂), 2.74 (d, J = 5.0 Hz, 8H, α-pyridyl-H), 4.39 (m, 16H, CH₂CH₂O), 5.58 (d, J = 5.0 Hz, 8H, β-pyridyl-H), 5.75 (s, vinyl-H), 5.87 (s, vinyl-H), 7.28 (s, 16H, Ar-H), 7.38 (br s, 8H, Py-MesP Ar-H), 8.11 (br s, 8H, Py-MesP β-H), 8.29 (s, 16H, Ar-H), 8.97 (d, J = 4.5 Hz, 16H, β-H₂), 9.67 (d, J = 4.0 Hz, 16H, β-H₁). ¹³C NMR (125.6 MHz, CDCl₃): δ 14.1 (CH₃Si), 14.4 (CH₃), 20.5 (Py-MesP-CH₃), 22.9 (CH₂), 24.6 (CH₂), 29.6 (CH₂CH₂O), 29.9 (CH₂CH=CHCH₂), 31.8 (CH₂), 33.5 (CH₂), 68.0 (CH₂CH₂O), 99.5 (Si≡C), 101.1 (Si≡C), 109.9 (C₁₀), 119.3 (Py-MesP-C₁), 122.3 (Ar-C₆), 123.6 (C₃), 126.0 (pyridyl-C₉), 130.1 (CH₂CH=CHCH₂), 130.6 (Ar-C₆), 131.1 (Ar-C₆), 132.6 (C₃), 132.7 (C₂), 133.6 (Py-MesP-C₅), 135.4 (Py-MesP-C₄), 136.4 (Py-MesP-Ar-C₆), 141.5 (Py-MesP-Ar-C₅), 149.9 (pyridyl-C₉), 150.8 (pyridyl-C₉), 152.0 (C₁), 152.5 (C₄), 159.1 (Ar-C₆). MALDI-ToF (linear negative mode): Calcd for [M - (Py-MesP)]⁻: 5117.28, found: m/z 5116.91 [M - (Py-MesP)]⁻. UV-vis (nm, (ε × 10⁵ /M⁻¹cm⁻¹)): 420 (3.2), 440 (5.9), 455 (3.8), 517 (0.1), 550 (0.1), 595 (0.2), 646 (0.8).
Detemplated hollow Zn-molecular box \((\text{Zn-PP})_4\). \((\text{Zn-PP})_4(\text{Py-MesP})\) (20 mg, 3.25 \(\mu\)mol) was dissolved in CH\(_2\)Cl\(_2/\)pyridine (9:1 v/v) and then subjected to size-exclusion chromatography (column dimensions = 20 mm \(\times\) 200 mm, Bio-Rad Bio-Beads S-X1, eluent = CH\(_2\)Cl\(_2/\)pyridine 9:1 v/v). Template-free hollow molecular box \((\text{Zn-PP})_4\) was collected from a dark purple band and the volatile s were removed under reduced pressure. To remove excess pyridine completely, the isolated purple solid was evacuated for 4 h at 60 \(^\circ\)C (16 mg, 96\%, 3.13 \(\mu\)mol). \(R_f = 0.15\) (CH\(_2\)Cl\(_2/\)hexanes = 1:2 v/v). \(\text{^1}H\) NMR (499.6 MHz, CDCl\(_3\)): \(\delta\) 0.94 (m, 72H, \(^n\)Hex CH\(_3\)), 1.22-1.61 (m, 240H, \(^n\)Hex CH\(_2\)), 2.28 (m, 16H, C\(_H\)\(_2\)CH\(_2\)O), 2.59 (m, 16H, CH=CHC\(_H\)\(_2\)), 4.46 (m, 16H, C\(_H\)\(_2\)C\(_H\)\(_2\)O), 5.84 (s, vinyl-H), 5.91 (s, vinyl-H), 7.38 (d, \(J = 7.0\) Hz, 16H, Ar-H), 8.04 (d, \(J = 7.5\) Hz, 16H, Ar-H), 8.52 (s, 16H, \(\beta\)-H\(_3\)), 8.72 (m, 16H, \(\beta\)-H\(_1\)). \(\text{^1}H\)\(^{13}\)C NMR (125.6 MHz, CDCl\(_3\)): \(\delta\) 14.0 (CH\(_3\)Si), 14.4 (CH\(_3\)), 22.9 (CH\(_2\)), 24.6 (CH\(_2\)), 29.6 (CH\(_3\)CH\(_2\O\)), 29.9 (CH\(_3\)CH=CHCH\(_3\)), 31.9 (CH\(_3\)), 33.6 (CH\(_2\)), 67.8 (CH\(_3\)CH\(_2\O\)), 99.9 (SiC\(_=\)C), 101.1 (SiC\(_=\)C), 112.9 (C\(_{10}\)), 122.3 (Ar-C\(_{10}\)), 122.4 (C\(_2\)), 130.2 (CH\(_3\)CH=CHCH\(_2\)), 130.9 (Ar-C\(_{19}\)), 132.5 (Ar-C\(_{19}\)), 134.9 (C\(_3\)), 135.9 (C\(_2\)), 150.5 (C\(_1\)), 152.0 (C\(_1\)), 159.0 (Ar-C\(_{1}\)). MALDI-ToF (linear negative mode): Calcd for C\(_{320}H_{432}N_{16}O_{8}Si_{8}Zn_{4}\): 5117.28, found: m/z 5115.17 [M]. Fig. S7 The \(\text{^1}H\) NMR spectrum for detemplated hollow Zn-molecular box \((\text{Zn-PP})_4\).

Demetallated hollow molecular box comprising of free base porphyrin \((\text{PP})_4\). To a magnetically stirred solution of \((\text{Zn-PP})_4(\text{Py-MesP})\) (80 mg, 13.0 \(\mu\)mol) in CH\(_2\)Cl\(_2\) (30 mL) in a 50 mL round bottom flask was added aqueous HCl (4 mL, 18.5 wt\%). After stirring for 15 min at room temperature, the resulting mixture was washed consecutively with water (50 mL), saturated NaHCO\(_3\) (30 mL), and brine (30 mL) before being dried over Na\(_2\)SO\(_4\) and filtered. The filtrate was then evaporated to dryness using a rotary evaporator and the remaining residue was subjected to silica gel column chromatography (column dimensions = 20 mm \(\times\) 200 mm, eluent = CH\(_2\)Cl\(_2/\)hexanes
(1:1.5 v/v) to yield the demetallated product (PP)$_4$ as a purple solid (59 mg, 93%, 12.1 μmol). $^1$H NMR (499.6 MHz, CDCl$_3$): δ -2.15 (s, 8H, NH$_2$), 0.89 (m, 72H, $^6$Hex CH$_3$), 0.99 (m, 48H, $^6$Hex CH$_2$), 1.37 (m, 96H, $^6$Hex CH$_2$), 1.52 (m, 48H, $^6$Hex CH$_2$), 1.73 (m, 48H, $^6$Hex CH$_2$), 2.19 (m, 16H, CH$_2$CH$_2$O), 2.50 (m, 16H, CH=CHCH$_2$), 4.37 (m, 16H, CH$_2$CH$_2$O), 5.75 (s, vinyl-H$_1$), 5.82 (s, vinyl-H$_2$), 7.36 (d, $J= 7.5$ Hz, 16H, Ar-H$_1$), 8.12 (d, $J= 7.5$ Hz , 16H, Ar-H$_2$), 8.87 (s, 16H, $^β$-H$_2$), 9.61 (s, 16H, $^β$-H$_1$). $^1$H$^{13}$C NMR (125.6 MHz, CDCl$_3$): δ 14.0 ($^1$CH$_2$Si), 14.4 ($^1$CH$_3$), 22.9 ($^1$CH$_2$), 24.6 (CH$_2$), 29.4 (CH$_2$CH$_2$O), 29.8 (CH$_2$CH=CHCH$_2$), 31.9 (CH$_2$, 33.6 (CH$_3$), 67.8 (CH$_2$CH$_2$O), 101.2 (Si≡C), 101.4 (Si≡C), 113.2 (C$_{10}$), 121.7 (Ar-C$_6$), 123.6 (C$_1$), 128.2 (CH$_2$CH=CHCH$_2$), 130.6 (Ar-C$_8$), 133.9 (Ar-C$_{11}$), 134.7 (C$_1$), 135.8 (C$_2$), 151.2 (C$_3$), 152.6 (C$_4$), 159.1 (Ar-C$_5$). MALDI-ToF (linear negative mode): Calcd for C$_{320}$H$_{440}$N$_{16}$O$_8$Si$_8$: 4863.70, found: m/z 4862.71 [M$^-$]. UV-vis (nm, ($ε$×10$^5$ /M$^-1$cm$^-1$)): 434 (17.6), 545 (0.6), 586 (2.4), 622 (0.4), 681 (1.0).

**Fig. S8** (a) The $^1$H NMR spectrum for demetallated hollow molecular box comprising of free base porphyrin (PP)$_4$. (b) The expanded region of $^1$H NMR spectrum with the detailed integration values.

Covalently linked hollow Al-molecular box (MeO-Al-PP)$_4$. Under a N$_2$ atmosphere, a 50 mL Schlenk flask equipped with a magnetic stir bar was loaded with a solution of free base porphyrin (PP)$_4$ (45 mg, 9.25 μmol) in anhydrous CH$_2$Cl$_2$ (15 mL). A solution of AlMe$_3$ (46 μL, 2.0 M in heptane) was then added to the reaction mixture using a gas-tight syringe under N$_2$. After stirring for 30 min under N$_2$, MeOH (20 mL) was added to quench the reaction and the mixture was evaporated to dryness under reduced pressure. The residue was subjected to size-exclusion chromatography (column dimensions = 30 mm × 250 mm, Bio-Rad Bio-Beads S-X1, eluent = CH$_2$Cl$_2$/MeOH 15:1 v/v/v) to afford (MeO-Al-PP)$_4$ as a purple solid (46 mg, 98%, 9.04 μmol). $^1$H NMR (499.6 MHz, CDCl$_3$/CD$_3$OD, 50 °C): δ 0.79-0.91 (br m, 72H, $^6$Hex CH$_3$), 0.94-1.13 (br m, 48H, $^6$Hex CH$_2$), 1.22-1.42 (br m, 96H, $^6$Hex CH$_2$), 1.51 (br m, 48H, $^6$Hex CH$_2$), 1.71 (br m, 48H, $^6$Hex CH$_2$), 2.21 (br m, 16H, CH$_2$CH$_2$O), 2.51 (br m, 16H, CH=CHCH$_2$), 4.20-4.45 (br s, 16H and 12H, CH$_2$CH$_2$O and OC$_3$), 5.84 (br s, vinyl-H$_1$), 7.21 (br s, 16H, Ar-H$_1$), 7.33-7.54 (br m, 16H, Ar-H$_2$), 8.54 (br s, 16H, $^β$-H$_2$), 9.38 (br s, 16H, $^β$-H$_1$). $^1$H$^{13}$C NMR (125.6 MHz, CDCl$_3$/CD$_3$OD): δ 13.7 (CH$_2$Si), 14.1 (CH$_3$), 22.6 (CH$_2$), 24.3 (CH$_2$), 29.6 (CH$_2$CH$_2$O), 31.5 (CH$_2$CH=CHCH$_2$), 319.2 (Si≡C)
31.8 (CH₂), 33.3 (CH₂), 58.5 (OCH₃), 67.7 (CH₂CH₂O), 99.8 (SiC≡C), 100.5 (SiC≡C), 107.5 (C₁₀), 112.8 (Ar-C₀), 120.9 (C₅), 128.8 (CH₂CH=CHCH₂), 130.4 (Ar-C₉), 131.1 (Ar-C₈), 134.9 (C₃), 136.3 (C₂), 145.6 (C₁), 147.6 (C₄), 158.9 (Ar-C). MALDI-ToF (reflective positive mode, pyrene matrix): Calcd for C₃₂₄H₄₄₄N₁₆O₁₂Si₈Al₄; m/z 5087.70, found: m/z 5056.99 [M - OMe]⁺, 5043.45 [M - OMe - CH₃]⁺, 5030.55 [M - AlOMe]⁺, 5015.20 [M - AlOMe - CH₃]⁺, 5000.05 [M - AlOMe - OMe]⁺. MALDI-ToF (reflective positive mode, dithranol matrix): Calcd for C₃₂₄H₄₄₄N₁₆O₁₂Si₈Al₄; m/z 5087.70, found: m/z 4999.19 [M - AlOMe - OMe]⁺, 4938.96 [M - 2(AlOMe) - OMe]⁺, 4879.25 [M - 3(AlOMe) - OMe]⁺. The use of the neutral pyrene matrix is critical; if another matrix containing acidic proton (such as dithranol matrix) was used, loss of the Al-OMe moieties is observed. ESIMS (positive mode): Calcd for C₃₂₄H₄₄₄N₁₆O₁₂Si₈Al₄; m/z 5087.70, found: m/z 2526.5710 [M + H - OMe]²⁺, 2512.5700 [M - 2OMe]²⁺. UV-vis (nm, (ε × 10⁴ /M⁻¹cm⁻¹)): 332 (7.5), 424 (75.2), 586 (4.4), 639 (11.4).

**Fig. S9** (a) The ¹H NMR spectrum for covalently linked hollow Al-molecular box (MeO-Al-PP)₄. (b) An expanded region of the ¹H NMR spectrum with the detailed integration values.

Fig. S11  MALDI-ToF MS spectrum of (MeO-Al-PP)$_4$ in the presence of pyrene matrix. Inset: an expanded region of the MALDI-ToF MS spectrum around the most intense peaks with a detailed peak assignment.

Fig. S12  High Resolution (HR) ESIMS spectrum of (MeO-Al-PP)$_4$. (positive mode).
Fig. S13  Theoretical (top) and experimental (bottom) isotope distribution patterns of the \( m/z = +2 \) peaks in HRESI mass spectrum: 2512 ([M + H - OMe]^{2+}) and 2526 ([M - 2OMe]^{2+}), showing matching isotopic distribution patterns for [M + H - OMe]^{2+} (a) and [M - 2OMe]^{2+} (b).

Fig. S14  \(^1\)H NMR spectra of: (a) Py-MesP template, (b) Zn-PP, (c) (Zn-PP)_4(Py-MesP), (d) (PP)_4, and (e) (MeO-Al-PP)_4. Spectra a-d were obtained in CDCl₃, whereas spectrum e were obtained in a mixture of CDCl₃ and CD₃OD (8.8:1 v/v) due to insufficient solubility of the assembly. This figure is a larger version of Fig. 1 in the main text.

Deinsertion of Py-MesP and subsequent reinsertion of the smaller DPyDPP template. Large Py-MesP template could not be completely reinserted back into the hollow (Zn-PP)_4 cavity at room temperature based on our observation of the chemical shifts of the pyridyl protons in the template, suggesting that the initial templation was a less-than-optimal tight fit. However, the smaller 5,15-bisphenyl-10,20-bis(4-pyridyl)porphyrin (DPyDPP) fitted well and can be used to partition the tetramer. This can be attributed to the E/Z isomers in the 4-octen-1,8-diy1 linkers, which make a large number of the assembled molecules smaller than the idealized all-cis isomer (Fig. S15).
Fig. S15  Schematic description of the deinsertion of Py-MesP and subsequent reinsertion of the smaller DPyDPP template to the cavity of hollow (Zn-PP)$_4$.

Possible geometrical isomers of (Zn-PP)$_4$ and (MeO-Al-PP)$_4$ and their conformations. As mentioned in the caption of Fig. 4 in the main text, (Zn-PP)$_4$ and (MeO-Al-PP)$_4$ are far from being idealized square objects due to the flexibility of the 4-octen-1,8-diyl connectors and their E/Z isomers, a result of the ring-closing metathesis reaction. In a MeOH-rich solvent mixture, the flexible alkyl chains would allow the hydrophobic porphyrin moieties to come closer to each others and the tetramers to adopt more compact shapes than the idealized shape shown in Fig 4. Furthermore, the different E/Z configurations in the 4-octen-1,8-diyl linkages lead to a total of six geometrical isomers, many of which are elongated in shapes (Fig. S16). The end results are structures that position the coordinated methoxide closer to the coordinated phosphate than shown in Fig. 4.

Fig. S16  Schematic description of the geometrical isomers of (MeO-Al-PP)$_4$ and their conformations. The elongation of these structures allow the methoxide ion to be closer to the coordinated phosphate.
**Fig. S17** Spectrophotometric titration of Zn-PP monomer (3.54 μM) in dichloromethane with aliquots (20 μL) of a solution of Py-MesP template (4.47 μM). Arrows show the directions of change in absorption with increasing Py-MesP concentration. Inset: absorbance change at 700 nm, showing an end point with 0.25 equiv of the template.

**Fig. S18** Electronic absorption spectra of Zn–PP, Py-MesP template, and covalently linked (Zn–PP)$_4$ (Py-MesP).

**Fig. S19** Analytical GPC traces of: (a) Zn-PP monomer, (b) (Zn-PP)$_4$ (Py-MesP), (c) detemplated hollow (Zn-PP)$_4$, (d) MeO-Al-PP monomer (5 vol% methanol added to the CH$_2$Cl$_2$ eluant), and (e) (MeO-Al-PP)$_4$ (5 vol% methanol added to the CH$_2$Cl$_2$ eluant).
VI. PFG-NMR measurements. Diffusion NMR experiments were carried on a Bruker Avance-III 600 MHz spectrometer equipped with a standard Bruker BBO probe with z-axis gradients, using the convection-compensated pulse sequence dstebpgp3s.8,9 The spectra were acquired using a 50 millisecond diffusion delay (“big delta”), a linear ramp of gradient strengths from 2 to 95% of full strength, and an interscan delay of 20 seconds to ensure quantitative peak integrations and intensities. Data were analyzed with two methods in Bruker’s Topspin program: 2D DOSY processing and line fitting analysis of individual peaks’ gradient-dependent decay curves. Both methods yielded comparable results. Measurements for Zn-PP monomer, (Zn-PP)$_4$(Py-MesP), and hollow (Zn-PP)$_4$ were made at 298 K using CDCl$_3$. Measurement for (MeO-Al-PP)$_4$ was made at 298 K in a mixture of CDCl$_3$ and CD$_3$OD (8.8:1 v/v) due to insufficient solubility. The Stokes-Einstein equation, $D_s = \frac{kT}{6\pi\eta a}$, was used to estimate hydrodynamic radius, $a$. In this equation, $k$ is Boltzmann’s constant, $T$ is the absolute temperature, and $\eta$ is the temperature-dependent viscosity of the medium ($\eta$(CDCl$_3$) = 0.563 cP and $\eta$(CD$_3$OD) = 0.570 cP). For the 8.8:1 v/v mixture of CDCl$_3$:CD$_3$OD, a composite viscosity of 0.564 cP is calculated from those of the two components using the rule of mixture.

**VII. General procedure for the synthesis of phosphate triesters.** Phosphate triesters were synthesized following a modified literature procedure.\textsuperscript{112} To a magnetically stirred solution of titanium tetrachloride (16.3 μL, 148.3 μmol, 2 mol%) in anhydrous THF (40 mL) in a 100 mL Schlenk flask was added 4-nitrophenol (1.14 g, 8.2 mmol, 1.1 equiv) at room temperature under N$_2$. A solution of diphenyl or dialkyl chlorophosphate (7.4 mmol) in anhydrous THF (5 mL) was then added using a gas-tight syringe, followed by triethylamine (2.1 mL, 14.89 mmol, 2.0 equiv), and the resulting mixture was allowed to stir for 1 h more. The resulting yellow solution was quenched by adding water (10 mL) and extracted with EtOAc (3 × 80 mL). The combined organic extracts were dried over MgSO$_4$, filtered, and concentrated under reduced pressure. Purification via silica gel column chromatography (column dimensions = 40 mm × 300 mm, eluent = EtOAc/hexanes = 1:3 or 1:1 v/v) afforded phosphate triesters.

**p-Nitrophenyl diphenyl phosphate (PNPDPP).** A white solid (86%). $R_f = 0.47$ (EtOAc/hexanes = 1:3 v/v). $^1$H
NMR (400.6 MHz, CDCl3): δ 7.21-7.24 (m, 6H, Ar-H), 7.33-7.38 (m, 6H, Ar-H), 8.22 (d, J = 9.2 Hz, 2H, Ar-H).

{1}H{13}C NMR (100.7 MHz, CDCl3): δ 120.2 (d, J = 4.4 Hz, Ar-CH), 121.0 (d, J = 5.8 Hz, Ar-CH), 125.9 (Ar-CH), 126.2 (d, J = 1.4 Hz, Ar-CH), 130.2 (Ar-CH), 150.2 (d, J = 7.4 Hz, Ar-C), 155.2 (d, J = 6.6 Hz, Ar-C).

{1}H{31}P NMR (161.9 MHz, CDCl3): δ -17.84. HRESIMS: Calcd for [C13H13O4P+H]+: 265.0640 [M+H]+, found: m/z 265.0640 [M+H]+.

Methyl diphenyl phosphate (MDPP). A colorless oil (99%). Rf = 0.25 (EtOAc / hexanes = 1:3 v/v). 1H NMR (400.6 MHz, CDCl3): δ 3.93 (d, J = 11.6 Hz, CH3O), 7.15-7.24 (m, 6H, Ar-H), 7.30-7.34 (m, 4H, Ar-H). 1H{13}C NMR (100.7 MHz, CDCl3): δ 55.5 (d, J = 6.6 Hz, CH3O), 120.1 (d, J = 5.1 Hz, Ar-CH), 125.9 (Ar-CH), 129.9 (Ar-CH), 150.6 (d, J = 6.6 Hz, Ar-C).

p-Nitrophenyl dipropyl phosphate (PNPDPpP). A pale yellow oil (87%). Rf = 0.25 (EtOAc / hexanes = 1:3 v/v).

1H NMR (400.6 MHz, CDCl3): δ 0.96 (t, J = 7.6 Hz, 6H, CH2), 1.73 (m, 4H, CH2), 4.14 (m, 4H, CH2O), 7.37 (d, J = 8.8 Hz, 2H, Ar-H), 8.23 (d, J = 9.2 Hz, 2H, Ar-H). 1H{13}C NMR (100.7 MHz, CDCl3): δ 10.0 (CH3), 23.6 (CH3), 70.6 (CH2O), 120.3 (d, J = 5.2 Hz, Ar-CH), 120.8 (d, J = 5.9 Hz, Ar-CH), 125.6 (d, J = 13.9 Hz, Ar-CH), 144.6 (Ar-C), 155.6 (d, J = 5.8 Hz, Ar-C).

{1}H{31}P NMR (161.9 MHz, CDCl3): δ -6.29. HRESIMS: Calcd for [C13H13O6P+H]+: 304.0945, found: m/z 304.0922 [M+H]+.

p-Nitrophenyl dibutyl phosphate (PNPDBPP). A pale yellow oil (62%). Rf = 0.35 (EtOAc / hexanes = 1:3 v/v).

1H NMR (400.6 MHz, CDCl3): δ 0.93 (t, J = 7.2 Hz, 6H, CH2), 1.40 (m, 4H, CH2), 1.69 (m, 4H, CH2), 4.18 (m, 4H, CH2O), 7.38 (d, J = 8.4 Hz, 2H, Ar-H), 8.24 (d, J = 8.8 Hz, 2H, Ar-H). 1H{13}C NMR (100.7 MHz, CDCl3): δ 13.6 (CH3), 18.7 (CH2), 32.2 (d, J = 6.6 Hz, CH2), 69.0 (d, J = 6.6 Hz, CH2O), 120.6 (d, J = 5.9 Hz, Ar-CH), 125.8 (Ar-CH), 144.7 (Ar-C), 155.6 (d, J = 6.6 Hz, Ar-C).

{1}H{31}P NMR (161.9 MHz, CDCl3): δ -6.40. HRESIMS: Calcd for [C13H13O6P+H]+: 332.1258, found: m/z 332.1218 [M+H]+.

VIII. Representative procedure for the methanolysis of p-nitrophenyl diphenyl phosphate (PNPDPP) catalyzed by a porphyrin molecular box. Under bench-top conditions, a 1 dram vial equipped with a magnetic stir bar was charged with PNPDPP (21.3 mg, 25 mM), the appropriate porphyrin catalyst ([MeO-Al-PP]4 or [Zn-PP]4, 3 mol%), and anhydrous CHCl3 (1.15 mL). Methanol (1.15 mL to make a 12.3 M solution) was then added to the reaction mixture at room temperature. The reaction vial was capped and allowed to stir at 333 K in an oil bath. Aliquots (0.16 mL) were periodically taken and filtered through a pad of silica gel, which was then washed with ethyl acetate (3 × 2 mL). The combined filtrates were concentrated in vacuo at room temperature, redissolved in CDCl3, and analyzed via {31}P NMR spectroscopy. The conversion of PNPDPP as a function of reaction time was
obtained by comparing the integrated areas under the resonances for PNPDPP and methyl diphenyl phosphate (MDPP) (Figs. S25 and S26).

**Fig. S25** \(^{31}\)P NMR spectra showing the progress of the methanolysis of PNPDPP to MDPP in the presence of 3 mol% (MeO-Al-PP)\(_4\) at 333 K, monitored by \(^{31}\)P NMR spectroscopy at: (a) 3 h, (b) 10 h, (c) 15 h, (d) 28 h, and (e) 49 h.

**Fig. S26** Reaction profiles for the methanolysis of PNPDPP (25 mM) carried out at 333 K, in a mixture of CHCl\(_3\) and CH\(_3\)OH (1:1 v/v) and in the presence of: (■) 0.75 mM (MeO-Al-PP)\(_4\), (●) 0.75 mM (Zn-PP)\(_4\), (▲) 3 mM MeO-Al-PP, (■) 3 mM Zn-PP, and (●) no catalyst. This figure is a larger version of Fig. 5 in the main text.
The observation of product formation rates for the methanolysis of PNPDPP catalyzed by several porphyrin species. Reactions were carried out as described above in section VIII with several porphyrin catalysts and conversion data were collected. As an example, the determination of the product formation rate for \((\text{MeO-Al-PP})_4\) was carried out as follows. To a 1 dram vial equipped with a magnetic stir bar was added PNPDPP (21.3 mg, 25 mM) and \((\text{MeO-Al-PP})_4\) (8.7 mg, 3 mol%). Anhydrous CHCl₃ (1.15 mL) and MeOH (1.15 mL to make a 12.3 M solution) was added and the vial was sealed with a Teflon-lined cap and the reaction was allowed to stir at 333 K in an oil bath. Aliquots (0.16 mL) were withdrawn after 20, 40, 60, 80, 100, 120, 140, and 160 min and filtered through a pad of silica gel, which was then washed with ethyl acetate (3 × 2 mL). The combined filtrates were concentrated \textit{in vacuo} at room temperature, redissolved in CDCl₃, and analyzed via $^{31}$P NMR spectroscopy to determine the yield of MDPP (Table S1).

Table S1 Product formation rates for the methanolysis of PNPDPP in the presence or absence of a porphyrin catalyst at 12.3 M MeOH. Reported catalyzed rates were background-corrected from uncatalyzed reactions.
Fig. S27  Possible pathways for the methanolysis of phosphate triesters in the presence of (a) MeO-Al-PP monomer, (b) Zn-PP monomer, (c) (MeO-Al-PP)$_4$ tetramer, and (d) (Zn-PP)$_4$ tetramer.
Fig. S28 The primary methanolysis of PNPDPP is proposed to be induced by methoxide in the presence of (a) MeO-Al-PP monomer and (b) (MeO-Al-PP)$_4$ tetramer.

IX. Estimation of the local concentration of methoxide in (MeO-Al-PP)$_4$.

If the shape of (MeO-Al-PP)$_4$ is assumed to be approximately spherical, the hydrodynamic volume is calculated by solving the equation:

$$V = \frac{4}{3} \pi a^3$$

where $a_1$ is the hydrodynamic radius (16.8 Å) obtained from PFG experiment (Fig. S30). Depending on the orientation of the methoxide ligand, two extreme situations arise. In one case, the methoxide ligands are all pointing outward from the cavity. In the other case, the methoxide ligands are all pointing inward. The local concentration range of methoxide in (MeO-Al-PP)$_4$ can then be calculated by dividing the number of moles of methoxide by the spherical volumes (V) enclosed by the outer and inner radii of the spheres carved out by the assembly in each case. From the PFG experiment in a mixture of CDCl$_3$ and CD$_3$OD (1:1 v/v), we calculated the outer radius of (MeO-Al-PP)$_4$ to be 16.8 Å (see data below). Subtracting ~3 Å from this gives the approximate radius of the smaller sphere (13.8 Å) where all methoxides are pointing inward. Hence, the local concentration range for the methoxide is bracketed by the following quantities:

$$\frac{(6.64 \times 10^{-24} \text{ mol})/(19.90 \times 10^{-24} \text{ L})}{0.334 \text{ M (larger sphere)}}$$
(6.64 × 10^{-24} \text{ mol})/(11.03 \times 10^{-24} \text{ L}) = 0.602 \text{ M (smaller sphere)}

This represents a 110-fold to 200-fold increase in concentration of methoxide over that of the MeO-Al-PP monomer concentration (0.003 M) that is used in our catalysis.

**PFG-NMR measurements for (MeO-Al-PP)$_4$ in the 1:1 (v/v) mixture of CDCl$_3$ and CD$_3$OD.** Samples were prepared by dissolving (MeO-Al-PP)$_4$ (0.79 mM) in a mixture of CDCl$_3$ and CD$_3$OD (1:1 v/v). Diffusion NMR experiments were performed under the same conditions as described above (Section VI) at 298 K on a Bruker Avance-III 600 MHz spectrometer. The Stokes-Einstein equation, $D_s = kT/6\pi\eta a$, was used to estimate hydrodynamic radius, $a$. In the equation, $k$ is Boltzmann’s constant, $T$ is the absolute temperature, and $\eta$ is the temperature-dependent viscosity of the medium ($\eta$(CDCl$_3$) = 0.563 cP\text{S10}$ and $\eta$(CD$_3$OD) = 0.570 cP\text{S11}$). A composite viscosity of 0.567 cP for the 1:1 v/v mixture of CDCl$_3$:CD$_3$OD is calculated from those of the two components using the rule of mixture.

Fig. S30 Top: The DOSY spectrum of (MeO-Al-PP)$_4$ in a mixture of CDCl$_3$ and CD$_3$OD (1:1 v/v) at 298 K. Bottom: Table of peak positions used for measuring diffusion constant of (MeO-Al-PP)$_4$ in a mixture of CDCl$_3$ and CD$_3$OD (1:1 v/v).

**Methoxide concentration in pure MeOH.** In pure methanol, the autoprotolysis constant ($K_{\text{auto,MeOH}}$)\text{S13}$ at room temperature can be calculated as follows:

\[
\text{CH}_3\text{OH} + \text{CH}_3\text{OH} \xrightarrow{K_{\text{auto,MeOH}}} \text{CH}_3\text{OH}_2^+ + \text{CH}_3\text{O}^-,
\]

where the methoxide concentration ([CH$_3$O$^-$]) must be equal to the protonated methanol concentration ([CH$_3$OH$_2^+$]).
Hence, we can replace the \([\text{CH}_3\text{OH}^2+]\) term in the \(K_{\text{auto,MeOH}}\) expression by another \([\text{CH}_3\text{O}^-]\) and the square root of each side gives the concentration of methoxide in pure methanol as \(4.5 \times 10^{-9}\) M.

\[
[\text{CH}_3\text{O}^-]^2 = 10^{-16.7} \text{M}^2
\]
\[
[\text{CH}_3\text{O}^-] = 4.5 \times 10^{-9} \text{M}
\]

**Non-geometrical estimates of the effective molarity of methoxide in \((\text{MeO-Al-PP})_4\)**

A simplistic way for estimate the effective methoxide molarity in \((\text{MeO-Al-PP})_4\) is to compare its rate for methoxide-only pathway against that of the \(\text{MeO-Al-PP}\) monomer in the following manner:

\[
\text{Rate}_\text{Al-monomer} = k_{\text{Al-monomer}}[\text{PNPDPP}][\text{MeO}^-]_{\text{Al-monomer}}
\]
\[
\text{Rate}_{\text{MeO-Al-PP}_4} = k_{\text{MeO-Al-PP}_4}[\text{PNPDPP}][\text{MeO}^-]_{\text{MeO-Al-PP}_4}
\]

Then the effective methoxide concentration in \((\text{MeO-Al-PP})_4\) is estimated as:

\[
[\text{MeO}^-]_{\text{MeO-Al-PP}_4} = \left(\frac{\text{Rate}_{\text{MeO-Al-PP}_4}}{\text{Rate}_\text{Al-monomer}}\right) \times \left(\frac{k_{\text{Al-monomer}}}{k_{\text{MeO-Al-PP}_4}}\right) \times [\text{MeO}^-]_{\text{Al-monomer}}
\]

However, because we do not know either the \(\left(k_{\text{Al-monomer}}/k_{\text{MeO-Al-PP}_4}\right)\) or the \(\left(\text{Rate}_{\text{MeO-Al-PP}_4}/\text{Rate}_\text{Al-monomer}\right)\) ratio for the methoxide-only pathway, this line of reasoning is unproductive.

Following established practices in enzymatic and supramolecular catalysis, a better way to evaluate the effectiveness of the \((\text{MeO-Al-PP})_4\) tetramer is by calculating its effective molarity (EM) parameter. The EM for the methanolysis catalyzed by \((\text{MeO-Al-PP})_4\) can be defined as the ratio of the intramolecular rate constant \(k_{\text{MeO-Al-PP}_4}\) to the intermolecular rate constant \(k_{\text{MeO-Al-PP}_4}\). However, because the methanolysis of PNPDPP by both the monomer and tetramer comprises several pathways (Fig. S27), several assumptions must be made before these two rate constants can be obtained. Our analysis is described below:

- The rate equations for the intermolecular methanolysis of PNPDPP catalyzed by \(\text{MeO-Al-PP}\) monomer, based on the reaction pathways shown in Fig. S27a, are:

  \[
  \text{Rate}_{\text{path1}}(\text{Al monomer}) = k_{\text{path1}}[\text{PNPDPP}][\text{MeOH-Almonomer}]
  \]

  \[
  ([\text{MeOH-Almonomer}] = \text{concentration of the coordinated MeOH to Almonomer} = [\text{Almonomer}])
  \]

  \[
  \text{Rate}_{\text{path2}}(\text{Al monomer}) = k_{\text{path2}}[\text{PNPDPP-Almonomer}][\text{MeOH}]
  \]

  \[
  ([\text{PNPDPP-Almonomer}] = \text{concentration of the coordinated PNPDPP to Almonomer} = [\text{Almonomer}])
  \]

  \[
  \text{Rate}_{\text{path3}}(\text{Al monomer}) = k_{\text{path3}}[\text{PNPDPP}][\text{MeO}^-]
  \]

  \[
  ([\text{MeO}^-] = [\text{Almonomer}])
  \]

  Overall rate(Al monomer) = \(\text{Rate}_{\text{path1}}(\text{Al monomer}) + \text{Rate}_{\text{path2}}(\text{Al monomer}) + \text{Rate}_{\text{path3}}(\text{Al monomer})\) = \(3.3 \times 10^{-9}\) M/s (Table S1)

- The rate equations for the intermolecular reactions catalyzed by the \(\text{Zn-PP}\) monomer, based on the reaction pathways shown in Fig. S27b, are:

  \[
  \text{Rate}_{\text{path1}}(\text{Zn monomer}) = k_{\text{path1}}[\text{PNPDPP}][\text{MeOH-Znmonomer}]
  \]

  \[
  \text{Rate}_{\text{path2}}(\text{Zn monomer}) = k_{\text{path2}}[\text{PNPDPP-Znmonomer}][\text{MeOH}]
  \]

  Overall rate(Zn monomer) = \(\text{Rate}_{\text{path1}}(\text{Zn monomer}) + \text{Rate}_{\text{path2}}(\text{Zn monomer})\) = \(2.7 \times 10^{-9}\) M/s (Table S1)

Assuming that the Lewis acidity of \(\text{MeO-Al-PP}\) and \(\text{Zn-PP}\) are the same, we can then consider the reaction rates...
induced by the coordinated MeOH and free MeOH to be the same for both \textit{MeO-Al-PP} (path 1 and path 2 in Fig. S27a) and \textit{Zn-PP} (path 1 and path 2 in Fig. S27b) monomers. Thus, the rate constant ($k_{\text{path3}}$) induced by the methoxide in \textit{MeO-Al-PP} monomer (path 3 in Fig. S27a) can be calculated by subtracting the $Rate_{\text{path1}}$ and $Rate_{\text{path2}}$ of the \textit{Zn-PP} monomer from the overall reaction rate for \textit{MeO-Al-PP} monomer.

\[
Rate_{\text{path3}}(\text{Al monomer}) = k_{\text{path3}}[\text{PNPDPP}][\text{MeO}^{-}] = 3.3 \times 10^{-9} - 2.7 \times 10^{-9} = 0.6 \times 10^{-9} \text{ M/s}
\]

OR: $k_{\text{path3}}(\text{Al monomer}) \approx \frac{0.6 \times 10^{-9}}{(0.025)(0.003)} = 8.0 \times 10^{-6} \text{ M}^{-1} \text{ s}^{-1}$

We note that this is actually a gross overestimate of the importance of the methoxide pathway for \textit{MeO-Al-PP} monomer. As shown in the main text, the slightly higher catalyzed-methanolysis rate for \textit{MeO-Al-PP} is actually due to a combination of its higher Lewis acidity than \textit{Zn-PP} and the presence of the methoxide.

- The rate equations for the intramolecular reactions catalyzed by (\textit{MeO-Al-PP})$_4$, based on the reaction pathways shown in Fig. 4 (reproduced in an alternate form in Fig. S27c for convenience) and the 2:1 encapsulation stoichiometry of PNPDPP obtained from our binding studies, are:

\[
\text{PNPDPP}_2-(\text{MeO-Al-PP})_4 (\text{MeOH})_2 \xrightarrow{k_{\text{path1}}} 2 \text{ MDPP}
\]

\[
Rate_{\text{path1}} = \frac{1}{2} k_{\text{path1}}[\text{PNPDPP}_2-(\text{MeO-Al-PP})_4(\text{MeOH})_2]
\]

assuming that there are only two vacant sites in the tetramer for coordinating MeOH, this is a minor pathway induced by coordinated MeOH

\[
\text{PNPDPP}_2-(\text{MeO-Al-PP})_4 + \text{MeOH} \xrightarrow{k_{\text{path2}}} 2 \text{ MDPP}
\]

\[
Rate_{\text{path2}} = \frac{1}{2} k_{\text{path2}}[\text{PNPDPP}_2-(\text{MeO-Al-PP})_4][\text{MeOH}]
\]

assuming that the concentration of encapsulated MeOH inside the tetramer does not change significantly from that in the reaction solution, this is a minor reaction pathway induced by free MeOH

\[
\text{PNPDPP}_2-(\text{MeO-Al-PP})_4 \xrightarrow{k_{\text{path3}}} 2 \text{ MDPP}
\]

\[
Rate_{\text{path3}} = \frac{d[P]}{dt} = \frac{1}{2} k_{\text{path3}}[\text{PNPDPP}_2-(\text{MeO-Al-PP})_4]
\]

this is the major pathway induced by localized methoxide

Overall rate(Al tetramer) = $Rate_{\text{path1}}$(Al tetramer) + $Rate_{\text{path2}}$(Al tetramer) + $Rate_{\text{path3}}$(Al tetramer) = $3.9 \times 10^{-7} \text{ M/s}$ (Table S1)

- By a similar analysis, the rate equations for the intramolecular reactions catalyzed by (\textit{Zn-PP})$_4$, based on the reaction pathways shown in Fig. 4 (reproduced in an alternate form in Fig. S27d for convenience) and the 2:1 encapsulation stoichiometry of PNPDPP obtained from our binding studies (see section XII below), are:

\[
\text{PNPDPP}_2-(\text{Zn-PP})_4 (\text{MeOH})_2 \xrightarrow{k_{\text{path1}}} 2 \text{ MDPP}
\]

\[
Rate_{\text{path1}}(\text{Zn tetramer}) = \frac{1}{2} k_{\text{path1}}[\text{PNPDPP}_2-(\text{Zn-PP})_4(\text{MeOH})_2]
\]

assuming that there are only two vacant sites in the tetramer for coordinating MeOH

\[
\text{PNPDPP}_2-(\text{Zn-PP})_4 + \text{MeOH} \xrightarrow{k_{\text{path2}}} 2 \text{ MDPP}
\]
Rate_{path2}(Zn tetramer) = \frac{1}{2} k_{path2}[PNPDPP_{2-}(Zn-PP)_4][MeOH]
assuming that the concentration of encapsulated MeOH inside the tetramer does not change significantly
from that in the reaction solution.

Overall rate(Zn tetramer) = Rate_{path1}(Zn tetramer) + Rate_{path2}(Zn tetramer)
= 1.3 \times 10^{-8} \text{ M/s} \quad \text{(Table S1)}

As in the monomer case, we can assume that the reaction rates induced by the coordinated MeOH and free MeOH
are the same for both (MeO-Al-PP)_4 (path 1 and path 2 in Fig. S27c) and (Zn-PP)_4 (path 1 and path 2 in Fig. S27d)
tetramers, the rate constant (k_{path3}) induced by the methoxide in (MeO-Al-PP)_4 tetramer (path 3 in Fig. S27c) can be
calculated by subtracting the Rate_{path1} and Rate_{path2} of the (Zn-PP)_4 tetramer from the overall reaction rate for
(MeO-Al-PP)_4 tetramer:

Rate_{path3}(Al tetramer) = \frac{1}{2} k_{path3}[PNPDPP_{2-}(MeO-Al-PP)_4] \approx 3.9 \times 10^{-7} - 1.3 \times 10^{-8} = 3.77 \times 10^{-7} \text{ M/s}

OR: 
k_{path3}(Al tetramer) \approx 2 \times 3.77 \times 10^{-7}/(0.00075) = 1.005 \times 10^{-3} \text{ s}^{-1}

Again, we note that this is probably a gross overestimate of the importance of the methoxide pathway for (MeO-Al-PP)_4. As shown in the main text, the slightly higher catalyzed-methanolysis rate of MeO-Al-PP monomer
(compared to Zn-PP) is actually due to a combination of its higher Lewis acidity (than Zn-PP monomer) and the
presence of the methoxide. In the line of reasoning, we expect that the (MeO-Al-PP)_4 tetramer would also have
higher Lewis acidity than (Zn-PP)_4 and Lewis acid activation of the PNPDPP substrate would be important.

From the estimated data for k_{path3}(Al tetramer) and k_{path0}(Al monomer), the EM parameter for the methoxide-
induced-only pathway catalyzed by (MeO-Al-PP)_4 can be calculated as follows:

k_{(MeO-Al-PP)_4}/k_{MeO-Al-PP monomer} = (1.005 \times 10^{-3} \text{ s}^{-1})/(8.0 \times 10^{-6} \text{ M}^{-1} \text{s}^{-1}) = 125 \text{ M}

This EM value is in the same range as the 110-200 fold increase in the localized methoxide concentrations that we
estimated from geometrical considerations (see above). Although this EM value is a simple number that can be
used for comparing the catalytic efficiency of (MeO-Al-PP)_4 against that of the MeO-Al-PP monomer and other
supramolecular catalyst systems, it oversimplifies the uniqueness of the large (MeO-Al-PP)_4 cavity in being able to
position up to 4 methoxide ions around 2 encapsulated PNPDPP substrates. In addition, while our geometrical
estimate of the local methoxide concentration reported at the beginning of this section IX may seem a bit naïve, it
allows for a separate estimate of the local methoxide concentration apart from the encapsulated PNPDPP. Lastly,
we note that the geometrical estimate does not require us to assume that the other two methanolysis pathways are
the same for the Zn and Al-OMe systems.

X. Product formation rates for the methanolysis of p-nitrophenyl dimethyl phosphate (PNPDMP), p-
nitrophenyl dipropyl phosphate (PNPDPrP), and p-nitrophenyl dibutyl phosphate (PNPDBP). Reactions
were carried out as described above in section VIII with several porphyrin catalysts and conversion data was
collected. The progress for the methanolysis of p-nitrophenyl dialky phosphates (25 mM) at 333 K in a mixture of
CHCl_3/MeOH (1:1 v/v) was analyzed via ^{31}P NMR spectroscopy to determine the yield of methanolyzed product.
At different times, aliquots (0.16 mL) were withdrawn from the reaction mixtures and filtered through a pad of
silica gel, which was then washed with ethyl acetate (3 \times 2 mL). ^{31}P NMR spectra were acquired with at least 500
scans on each sample. The chemical shifts of the methanolized product for each phosphate substrate were compared with the authentic samples synthesized by following a modified literature procedure.\textsuperscript{512}

XII. Measurement of binding constants by UV-vis and fluorescence titrations. The UV-vis spectrophotometric titrations were conducted by progressively adding small aliquots (5 µL) of guest solution (15.6 M for neat MeOH or 1.3 M for PNPDPP in CHCl₃), using a 25 µL microsyringe, to a cuvette containing the porphyrin tetramer solution (2.3 mL of a 0.39 µM solution in CHCl₃) or the porphyrin monomer solution (2.3 mL of a 1.54 µM solution in CHCl₃). To minimize the change of the solution volume, the maximum total added volume for all aliquots of the guest solutions was less than 100 µL. As an example for the analysis of UV-vis titration data, the difference in absorbance (∆A) of the (MeO-Al-PP)₄ in the presence and absence of the guest was calculated and the data were plotted against [guest] (guest = MeOH or PNPDPP, Fig. S31 and Fig. S32). Simultaneous binding of the guest to the host was assumed to vary in the 1:n stoichiometries ((MeO-Al-PP)₄·guest) and the binding constants \( K_a \) for these species were derived using the Marquardt least-squares minimization\(^{S15}\) based on the equations:

\[
\frac{([\text{MeO-Al-PP}]_4 \cdot \text{Ln})_{\text{calc}}}{[\text{MeO-Al-PP}]_4 + ([\text{MeO-Al-PP}]_4 \cdot \text{Ln})}\]

\( (S4) \)

Eq S4 indicates that \([([\text{MeO-Al-PP}]_4 \cdot \text{Ln}]_{\text{exp}} - ([\text{MeO-Al-PP}]_4 \cdot \text{Ln})_{\text{calc}})^2\)\(^{S15}\) To obtain the speciation distribution diagrams shown as an inset in Fig. S31a and Fig. S32a, we performed MCR-ALS (multivariable curve resolution-alternative least square) analysis.\(^{S16}\) The quality of the fitting between calculated curve and experimental titration data indicates that single-guest-binding mode for ([MeO-Al-PP]₄·MeOH) and two-guest-binding mode for ([MeO-Al-PP]₄·PNPDPP) are reasonable in CHCl₃.

Fitting the speciation distribution of ([MeO-Al-PP]₄·MeOH) for the MeOH binding to Eq S4 gave a good fit with a binding constant of \( K_a = 7.5 \text{ M}^{-1} \) (n = 1). Additionally, fitting the speciation distribution of ([MeO-Al-PP]₄·PNPDPP) for the PNPDPP binding to Eq S4 gave a good fit with a binding constant of \( K_a = 2570 \text{ M}^{-2} \) (n = 2), indicating that two PNPDPP are simultaneously coordinating to one (MeO-Al-PP)₄. This fitting result reveals that the binding constant for one PNPDPP could be \( K_a = (2570 \text{ M}^{-2})^{1/2} = 50.7 \text{ M}^{-1} \). Similarly, the speciation distributions for (Zn-PP)₄ are [(Zn-PP)₄·MeOH] and [(Zn-PP)₄·PNPDPP]₂. As expected, the speciation distributions for the Zn-PP monomer are [(Zn-PP)·MeOH] and [(Zn-PP)·PNPDPP]; and those for the MeO-Al-PP monomer are [(MeO-Al-PP)·(MeOH)] and [(MeO-Al-PP)·(PNPDPP)]; respectively.

ᵃUV-vis titration experiments of MeOH and PNPDPP were carried out at 296 K in CHCl₃. The solutions of the porphyrin boxes were 0.39 μM and the solutions of the porphyrin monomers were 1.54 μM.
The fluorescence titrations were carried out by progressively adding small aliquots (5 µL) of PNPDPP solution (1.3 M, PNPDPP stock solutions in CHCl₃/MeOH (1:1 v/v)), using a 25 µL microsyringe, to a quartz fluorescence cuvette containing the porphyrin box solution (1 mL of a 0.02 µM solution in CHCl₃/MeOH (1:1 v/v)) or the porphyrin monomer solution (1 mL of a 0.04 µM solution in CHCl₃/MeOH (1:1 v/v)). To minimize the change of the solution volume, the maximum total added volume for all aliquots of the guest solution was less than 100 µL. The solution was excited at 442 nm and the fluorescent emission intensity was recorded from 500 to 800 nm after each addition of PNPDPP. A plot of intensity versus [PNPDPP] was carried out to yield the binding constant \(K_a\) by the nonlinear fitting method described above.\(^{315}\)

*Fluorescence titration experiments of PNPDPP were carried out at 296 K in a mixture of CHCl₃/MeOH (1:1 v/v). The solutions of the porphyrin boxes were 0.02 μM and the solution of the porphyrin monomers were 0.04 μM.
The predicted binding constants of PNPDPP ($K_{\text{PNPDPP}}$) to (MeO-Al-PP)$_4$ and (Zn-PP)$_4$ in a mixture of CHCl$_3$/MeOH (1:1 v/v) based on the $K_{\text{PNPDPP}}$ and $K_{\text{MeOH}}$ in pure CHCl$_3$. The speciation distributions obtained from MCR-ALS (multivariable curve resolution-alternative least square) analysis$^{10}$ (Figs. S31-S34) indicate two-guest-binding mode for [H·(PNPDPP)$_2$] and single-guest-binding mode for [H·MeOH] (H = (MeO-Al-PP)$_4$ and (Zn-PP)$_4$ hosts). Thus, the binding constant of PNPDPP to the porphyrin tetramer host (H) in pure CHCl$_3$ ($K_{\text{PNPDPP(CHCl}_3)}$) can be calculated as follows:

$$H + 2 \text{PNPDPP} \rightleftharpoons \text{H·PNPDPP}_2$$

$$K_{\text{PNPDPP(CHCl}_3, M^{-2})} = \frac{[\text{H·PNPDPP}_2]}{[\text{H}][\text{PNPDPP}]^2} \quad (S5)$$

From Table S6, $K_{\text{PNPDPP(CHCl}_3)}$, the experimental binding constant of PNPDPP to the porphyrin tetramer host (H) in pure CHCl$_3$ is $2570 \pm 173$ M$^{-2}$ for (MeO-Al-PP)$_4$ and $924 \pm 118$ M$^{-2}$ for (Zn-PP)$_4$.

The binding constants of MeOH to the porphyrin tetramer host (H) in pure CHCl$_3$ ($K_{\text{MeOH(CHCl}_3)}$) can be calculated as follows:

$$H + \text{MeOH} \rightleftharpoons \text{H·MeOH}$$

$$K_{\text{MeOH(CHCl}_3, M^{-1})} = \frac{[\text{H·MeOH}]}{[\text{H}][\text{MeOH}]}$$

$$\frac{[\text{H·MeOH}]}{[\text{H}]} = K_{\text{MeOH}[\text{MeOH}]} \quad (S6)$$

From Table S6, $K_{\text{MeOH(CHCl}_3)}$, the experimental binding constant of MeOH to porphyrin boxes (H) in pure CHCl$_3$ is $7.5 \pm 0.5$ M$^{-1}$ for (MeO-Al-PP)$_4$ and $4.0 \pm 0.2$ M$^{-1}$ for (Zn-PP)$_4$.

In a mixture of CHCl$_3$/MeOH (1:1 v/v), the association constant of PNPDPP to the porphyrin box (H) at room temperature ($K_{\text{PNPDPP(CHCl}_3/\text{MeOH})}$) can be expressed as:

$$(H + H\cdot\text{MeOH}) + 2 \text{PNPDPP} \rightleftharpoons \text{H·PNPDPP}_2$$

$$K_{\text{PNPDPP(CHCl}_3/\text{MeOH}, M^{-2})} = \frac{[\text{H·PNPDPP}_2]}{([H]+[H\cdot\text{MeOH}])[\text{PNPDPP}]^2} = \frac{[\text{H·PNPDPP}_2]}{(1+K_{\text{MeOH(CHCl}_3}[\text{MeOH}])[\text{H}][\text{PNPDPP}]^2}$$

$$= \frac{K_{\text{PNPDPP(CHCl}_3)}}{1+K_{\text{MeOH(CHCl}_3}[\text{MeOH}]} \quad (S7)$$

In a mixture of CHCl$_3$/MeOH (1:1 v/v, 12.3 M MeOH),

$$K_{\text{PNPDPP(CHCl}_3/\text{MeOH})} \text{ for (MeO-Al-PP)$_4$} = (2570 \text{ M}^{-2})(1 + (7.5 \text{ M}^{-1} \times 12.3 \text{ M})) = 27.6 \text{ M}^2$$

From this, the predicted association constant of one PNPDPP to (MeO-Al-PP)$_4$ at 12.3 M MeOH is:
\(K_{a(PNPDPP)} = (K_{PNPDPP})^{1/2} = (27.6 \text{ M}^{-2})^{1/2} = 5.3 \text{ M}^{-1}\).

In a mixture of CHCl\(_3/\text{MeOH}\) (1:1 v/v, 12.3 M MeOH),

\(K_{PNPDPP}\) for \((\text{Zn-PP})_4 = (924 \text{ M}^{-2})/(1 + (4.0 \text{ M}^{-1} \times 12.3 \text{ M})) = 18.4 \text{ M}^2\)

From this, the predicted association constant of one PNPDPP to \((\text{Zn-PP})_4\) at 12.3 M MeOH is:

\(K_{a(PNPDPP)} = (K_{PNPDPP})^{1/2} = (18.4 \text{ M}^{-2})^{1/2} = 4.3 \text{ M}^{-1}\)

**Standard error of predicted \(K_a\) values.** To calculate the standard error of predicted \(K_a\) values based on the uncertainty of experimental \(K_a\), established error propagation equations were used.\(^{17}\) The calculation process for the predicted \(K_{a(PNPDPP)}\) to \((\text{MeO-Al-PP})_4\) is described as follows.

\[
K_{a(PNPDPP)}(\text{CHCl}_3/\text{MeOH}, \text{M}^4) = \frac{2570 \pm 173 \text{ M}^2}{1 + (7.5 \pm 0.5 \text{ M}^{-1} \times 12.3 \times 0.1 \text{ M})} = (27.6 \pm \delta_m) \text{ M}^{-2} \tag{S8}
\]

\[
K_{a(PNPDPP)}(\text{CHCl}_3/\text{MeOH}, \text{M}^4) = (K_{PNPDPP})^{1/2} = (5.3 \pm \delta_f) \text{ M}^{-1} \tag{S9}
\]

To determine the uncertainty \(\delta_m\) of the predicted \(K_{a(PNPDPP)}\) in Eq S9, we first calculate the uncertainty \(\delta_m\) of the denominator \((7.5 \pm 0.5 \text{ M}^{-1} \times 12.3 \pm 0.1 \text{ M})\) in Eq S8. If dependent variables \(x\) and \(y\) are related to the measured quantities \(a\) and \(c\) by the relations:

\[
x = a \pm b
\]
\[
y = c \pm d
\]

\((\pm b\) and \(\pm d\) are standard errors)

then the uncertainty \(\delta_m\) of the multiplication of these variables \((z = x \times y = (a \pm b \times c \pm d))\) is given by:

\[
\delta_m = (a \times c) \times (b^2/a^2 + d^2/c^2)^{1/2}
\]

So the \(\delta_m\) value of the denominator is \((7.5 \times 12.3) \times (0.5^2/7.5^2 + 0.1^2/12.3^2)^{1/2} = 6.2\)

OR:

\[
K_{a(PNPDPP)}(\text{CHCl}_3/\text{MeOH}, \text{M}^4) = \frac{2570 \pm 173 \text{ M}^2}{93.3} = (27.6 \pm 6.2) \text{ M}^{-2}
\]

Similarly, if \(x = a \pm b\) and \(y = c \pm d\), then the uncertainty \(\delta_d\) of division \((z = x/y = (a \pm b)/(c \pm d))\) is given by:

\[
\delta_d = (a/c) \times (b^2/a^2 + d^2/c^2)^{1/2}
\]

So the \(\delta_d\) value is \((2570/93.3) \times (173^2/2570^2 + 6.2^2/93.3^2)^{1/2} = 2.6\).

OR:

\[
K_{a(PNPDPP)}(\text{CHCl}_3/\text{MeOH}, \text{M}^4) = (27.6 \pm 2.6) \text{ M}^{-2}
\]

Finally, if \(x = a \pm b\), then the uncertainty \(\delta_f\) of \(z\) powered by \(1/2\) \((z = x^{1/2} = (a \pm b)^{1/2})\) is given by:

\[
\delta_f = (1/2) \times (a)^{1/2} \times (b/a)
\]

Thus, the final \(\delta_f\) value is \((1/2) \times (27.6)^{1/2} \times (2.6/27.6) = 0.3\).

\[
K_{a(PNPDPP)}(\text{CHCl}_3/\text{MeOH}, \text{M}^4) = (5.3 \pm 0.3) \text{ M}^{-1}
\]
The same calculation procedure for $\text{(Zn-PP)}_4$ provides the uncertainty ($\delta f$) of the predicted $K_a(\text{PNPDPP})$ as 0.3.

### Table S8

The predicted binding constants of PNPDPP ($K_a(\text{PNPDPP})$) to $\text{(MeO-Al-PP)}_4$ and $\text{(Zn-PP)}_4$ in a mixture of CHCl$_3$/MeOH (1:1 v/v).

$^a$Experimental $K_a(\text{PNPDPP})$ values were obtained from the room-temperature fluorescence titration of PNPDPP to 0.02 μM solution of the porphyrin boxes in a mixture of CHCl$_3$/MeOH (1:1 v/v). See the complete data set in Table S7.
XIII. NMR studies of the encapsulation of PNPDPP in (MeO-Al-PP)$_4$ or (Zn-PP)$_4$.

Fig. S41 Variable-temperature (VT) $^1$H NMR (400 MHz) spectra of a combination of porphyrin species (0.03 or 0.12 equiv) and PNPDPP (1.0 equiv) in a mixture of CDCl$_3$ and CD$_3$OD (1:1 v/v) at 298 and 333 K: (a) [Zn-PP] = 3.0 mM and [PNPDPP] = 25 mM, (b) [(Zn-PP)$_4$] = 0.75 mM and [PNPDPP] = 25 mM, (c) [MeO-Al-PP] = 3.0 mM and [PNPDPP] = 25 mM, (d) [(MeO-Al-PP)$_4$] = 0.75 mM and [PNPDPP] = 25 mM. Spectra were collected within 1 h of sample preparation to ensure that no significant conversion has occurred.
Fig. S42  The DOSY NMR (600 MHz) spectrum of a combination of (MeO-Al-PP)$_4$ (0.03 equiv) and PNPDPP (1.0 equiv) in a mixture of CDCl$_3$ and CD$_3$OD (1:1 v/v) at 298 K; [(MeO-Al-PP)$_4$] = 0.75 mM and [PNPDPP] = 25 mM. Spectrum was collected within 2 h of sample preparation to ensure that no significant conversion has occurred.

Fig. S43  $^{31}$P NMR (161.9 MHz) spectra at different temperatures for: (a) PNPDPP (25 mM) in a mixture of CDCl$_3$ and CD$_3$OD (1:1 v/v), (b) a combination of (MeO-Al-PP)$_4$ (0.75 mM) and PNPDPP (25 mM) in a mixture of CDCl$_3$ and CD$_3$OD (1:1 v/v). Spectra were collected within 2 h of sample preparation to ensure that no significant conversion has occurred.

Table S9  The full width at half maximum (FWHM) of the $^{31}$P NMR signals for the spectra shown in Fig. S43.

XIV. Author contributions audit: B.K. and S.T.N. conceived the experiments presented herein. B.K. synthesized all compounds except tetrakis(4(4’-pyridyl)-3,5-dimethylphenyl))porphyrin (Py-MesP), which was synthesized by K.T.Y. B.K. carried out the characterization of all compounds, the catalysis experiments, and the UV-vis and fluorescence titration experiments. J.W.K carried out the PFG-NMR experiments. R.K.T. carried out several control experiments. J.T.H. and S.T.N. supervised the project. B.K. wrote the initial draft of the paper and received inputs and corrections from all co-authors. B.K. and S.T.N. finalized the manuscript.
