**General Methods.** Compounds 6-9 were prepared according to the previously published literature reports.\(^1\)\(^-\)\(^5\) 1\(^H\) and 13\(^C\) NMR spectra were obtained on a Varian 300 MHz spectrometer (\(^1\)H 299.95 Hz, 13\(^C\) 75.43 Hz), Inova 500 MHz spectrometer (\(^1\)H 500.10 MHz, 13\(^C\) 125.75 MHz) or Varian 600 MHz spectrometer. Chemical shifts (\(\delta\)) are expressed in ppm from solvent signal using non-deuterated solvent present in the bulk deuterated solvent (DMSO-d6: \(^1\)H 2.5 ppm, 13\(^C\) 39.52 ppm). Unless otherwise specified, solvents were obtained from distillation using published literature procedures directly before use. Mass spectra were acquired Waters LCT Premier ESI-MS in positive mode in MeCN solvent. UV-Vis spectra were acquired with a Hewlett-Packard 8453 UV-Visible spectrophotometer equipped with a 250 nm cutoff filter. Fluorescence data was acquired with a Horiba Jobin-Yvon FluoroMax-4 fluorescence spectrophotometer equipped with an integrating sphere. Absolute photoluminescence quantum yields were taken in triplicate in \(\text{O}_2\)-containing (no inert gas purging) MeCN.

**General TMS Deprotection Procedure A.** To a solution of 4-substituted-2-(trimethylsilylethynyl)aniline (6-9, 1 equiv) in 2:1 MeOH/Et\(_2\)O (0.1 M) was added K\(_2\)CO\(_3\) (5 equiv) at room temperature. After stirring for 30 min, the reaction mixture was diluted with water and extracted with CH\(_2\)Cl\(_2\). The organic layer was dried over MgSO\(_4\), filtered and concentrated under reduced pressure to give the desilylated product which was used without further purification.

**General Cross Coupling Procedure B.** To an Ar degassed solution of 2,6-dibromopyridine (1 equiv) in 1:1 THF/DIPA (0.05 M) were added CuI (0.2 equiv) and Pd(PPh\(_3\))\(_4\) (0.1 equiv) at room temperature. The solution was degassed with Ar for an additional 30 min and then heated to 50 °C. To this solution a second degassed solution
of 2-ethynyl-4-substituted aniline (2.2 equiv) in THF (20 mL) was cannula transferred. After stirring for 16 h, the reaction mixture was cooled, diluted with CH₂Cl₂, and filtered through a 4 cm pad of silica. The filtrate was concentrated under reduced pressure. The crude product was purified by flash chromatography over silica gel to give the desired dianiline product.

**General Urea Formation Procedure C.** To a stirred solution of 2,6-bis(2-anilinoethyl)pyridine (6-9, 1 equiv) in dry toluene (0.01 M) was added the appropriate phenylisocyanate reagent (3-10 equiv). The reaction was stirred at rt-80 °C for 3 h-2 d. The resulting suspension was diluted in hexanes and the solid precipitate was collected via vacuum filtration. The solid was redissolved in a minimal amount of 10:1 acetone/TFA and hexanes was added until the solution became cloudy. The resulting suspension was cooled and the precipitate was collected via vacuum filtration affording the desired product.

Discussion of 2-quinazolinone side-product:

Scheme S1. Observed 6-exo-dig cyclization pathway (top); typical but unobserved 5-endo-dig cyclization pathway (bottom).

While attempting to synthesize 4d a small amount of an unexpected 2-quinazolinone was isolated and its crystal structure was solved. To our knowledge this is the first reported example of a 2-quinazolinone resulting from a 6-exo-dig cyclization pathway with an internal alkyne (Scheme S1) as typically a 5-endo-dig cyclization occurs. Additionally, the x-ray crystal structure shows that one of the resulting alkenes is in the $E$ conformation, which the other is in a $Z$ conformation, resulting in an unusual twisted structure (Figure S1). CCDC-844849 contains the supplementary crystallographic data for this molecule, which can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.
