I. General Information

Unless noted, all catalytic reactions were set up inside an inert atmosphere (N₂) glovebox utilizing glassware that was oven-dried (150 °C) and evacuated while hot prior to use, whereas the work-up and isolation of the products from the catalytic reactions were conducted on the bench-top using standard techniques. Dichloroethane and other solvents were passed through a column of activated alumina under nitrogen and were stored in a glovebox over activated 4 Å molecular sieves prior to use. Chloroform-d₁ (Cambridge Isotopes) was used as received. All aldehydes were freshly distilled or purified by flash column chromatography before use. Unless otherwise noted, all other reagents and materials were obtained from commercial suppliers and used without further purification. [Cp*RhCl₂]₂ and N-methoxybenzimidates² were synthesized according to published procedures. Chromatography was performed on Merck 60 230-240 mesh silica gel. ¹H and ¹³C{¹H} NMR characterization data were collected at 300K on a Bruker AV-500 spectrometer operating at 500.1 and 125.8 MHz (respectively) with chemical shifts reported in parts per million relative to CHCl₃ (¹H NMR; 7.26 ppm, ¹³C{¹H} NMR; 77.00 ppm). IR spectra were recorded on a Nicolet 6700 FTIR spectrometer and only partial data are provided. Melting points were determined on a Mel-Temp apparatus and are reported uncorrected. Mass spectra (HRMS) were obtained by the Keck Center of Yale University using a Bruker 9.4 TAPEXqe FT-ICR mass spectrometer.
II. Preparation of starting materials

**General Procedure for Preparation N-Methoxybenzimidates:** To a 250 mL round-bottom flask was added O-methylhydroxylamine hydrochloride (2.00 g, 24.0 mmol, 1.2 equiv) and a stir bar, and the flask was then fitted with a rubber septum. The flask was purged with nitrogen followed by the addition of anhydrous CH₂Cl₂ (100 mL) and the aroyl chloride (20.0 mmol, 1.0 equiv). The mixture was cooled to 0 °C in an ice-water bath. Pyridine (4.83 mL, 60 mmol, 3.0 equiv) was added slowly with stirring, and the solution was allowed to warm to rt overnight. The reaction was quenched with water (300 mL), and the resulting mixture was extracted with CH₂Cl₂ (3 x 100 mL). The organic layers were combined and dried over MgSO₄ followed by removal of the solvent under reduced pressure and then at high vacuum for 2 h to remove any residual pyridine. The white solid or viscous oil was transferred to a 100 mL oven-dried round-bottom flask with a stir bar, and dried benzene (60 mL) was added. The solution was cooled to 5 °C, and PCl₅ (6.25 g, 30.0 mmol, 1.5 equiv) was added in one portion. The heterogeneous mixture was stirred at 5 °C for 2 h and then allowed to warm to rt. The solution was poured into a separatory funnel containing hexane (150 mL) and water (150 mL). The organic layer was washed with additional water (150 mL) and brine (150 mL) and then dried over MgSO₄ followed by removal of solvent under reduced pressure. The pale yellow residue was then dissolved in dry THF (150 mL) in a round-bottom flask with a stir bar, and sodium methoxide (5.40 g, 100 mmol, 5.0 equiv) was added in one portion. The heterogeneous solution was heated to reflux with stirring overnight. The mixture was cooled to rt and poured into a separatory funnel containing ether (150 mL) and water (150 mL). The organic layer was washed with additional water (150 mL) and brine (150 mL).
mL) and then dried over MgSO₄ followed by removal of solvent under reduced pressure. The residue was purified by flash column chromatography with hexane/EtOAc on silica gel to afford the benzimidates as colorless oils.
