All reactions were run under an atmosphere of argon, unless otherwise indicated. Anhydrous solvents were transferred via oven-dried syringe. Reaction tubes were oven-dried and cooled under a stream of argon. Reactions tubes were purchased from Fischer Scientific (catalog number 14-959-35C). Toluene and 1,4-dioxanes were purified from sodium and benzophenone. RuHCl(CO)(PPh₃)₃ was prepared according to literature procedure.¹ Ni(COD)₂ and all ligands were used as received from Strem Chemicals Inc. Isopropanol (99.8%, extra dry) and paraformaldehyde were obtained and used as received from Acros Organics. For nickel catalysis, paraformaldehyde was purchased and immediately taken into the drybox, where it was stored in the refrigerator. Ni(COD)₂, PCy₃, and Cs₂CO₃ were purchased from Aldrich and stored in the drybox prior to use. Unless noted otherwise, 2-substituted dienes 1-14 were prepared in accordance with literature procedure.² Analytical thin-layer chromatography (TLC) was carried out using 0.25 mm commercial silica gel plates (Dynamic Adsorbents F₂₅₄) and products were visualized by UV, KMnO₄ and/or anisaldehyde stain. Preparative column chromatography employing Silicycle silica gel (40-63 μm) was performed according to the method of Still.³ Infrared spectra were recorded on a Perkin-Elmer 1600 spectrometer. High-resolution mass spectra (HRMS) were obtained on a Karatos MS9 and are reported as m/z (relative intensity). Accurate masses are reported for the molecular ion [M+H]⁺ or a suitable fragment ion. Proton nuclear magnetic resonance (¹H NMR) spectra were recorded with a Varian Gemini (400 MHz) spectrometer. Chemical shifts are reported in delta (δ) units, parts per million (ppm) downfield from tetramethylsilane or ppm relative to the center of the singlet at 7.26 ppm for deuteriochloroform. Coupling constants are reported in Hertz (Hz). Carbon-13 nuclear magnetic resonance (¹³C NMR) spectra were recorded with a Varian Gemini or 400 (100 MHz) spectrometer. Chemical shifts are reported in delta (δ) units, ppm relative to the center of the triplet at 77.0 ppm for deuteriochloroform.¹³C NMR spectra were routinely run with broadband decoupling. Fluorine-19 nuclear magnetic resonance (¹⁹F NMR) spectra were recorded with a Varian Gemini or 400 (100 MHz) spectrometer. Deuterium nuclear magnetic resonance (²H NMR) spectra were recorded in CHCl₃ solution with a Varian Gemini 500 (77 MHz) spectrometer (relaxation delay 2.00 s).

VI. Experimental Procedures and Spectroscopic Data for the Nickel Catalyzed Regioselective Couplings at the C₄ – position

General Procedure D for the coupling of 2-substituted dienes 12-13 to paraformaldehyde

An oven dried re-sealable pressure flask equipped with stir bar was charged with Ni(COD)₂ (28 mg, 0.10 mmol, 20 mol%), PCy₃ (28 mg, 0.10 mmol, 20 mol%) and paraformaldehyde (60 mg, 2.0 mmol, 400 mol%) inside of a drybox. The flask was sealed and removed from the drybox. Under a flow of argon, toluene was added to the flask (2 mL, 0.25 M relative to diene). While stirring, the diene (0.5 mmol, 100 mol%) was added. The flask was sealed and placed in an oil bath at 60 °C for 24 h. The reaction mixture was allowed to cool to room temperature, at which point methanolic KOH (1.0 M) was added and stirred for 2 h. CH₂Cl₂ (30 mL) was added and the mixture was washed with HCl (1.0 M). The organics were removed and the aqueous layer was extracted twice with CH₂Cl₂ (15 mL). The combined organics were dried (Na₂SO₄), filtered, and evaporated to dryness. The crude residue was purified by flash column chromatography (SiO₂) to furnish the title compounds.
