1. Materials

All starting materials and dehydrated solvents were purchased from Aldrich (Milwaukee, WI), Wako Pure Chemical Industries (Osaka, Japan), and Tokyo Chemical Industry (Tokyo, Japan) unless otherwise noted. Silica gel (SiO₂) and aminopropyl-modified silica gel (NH-SiO₂) for the flash chromatography were purchased from Merck (Darmstadt, Germany) and Fuji Silysia Chemical Ltd. (Kasugai, Japan), respectively. Bio-Beads SX-1 for the SEC was purchased from Bio-Rad Laboratories. Compounds 1C, 1, 2C, 1, 4A, 2, 4C, 3, TAA, 4, A-H, 2, C-H, 3 and 5 were prepared according to the previously reported methods.

2. Instruments

The melting points were measured using a Yanaco MP-500D melting point apparatus (Kyoto, Japan) and were uncorrected. The NMR spectra were obtained using a Varian UNITY INOVA 500AS spectrometer operating at 500 MHz for ¹H and 125 MHz for ¹³C. Chemical shifts are reported in parts per million (δ) downfield from tetramethysilane (TMS) as the internal standard in CDCl₃. The recycling preparative HPLC was performed with an LC-928R liquid chromatograph (Japan Analytical Industry, Tokyo, Japan) equipped with two SEC columns (JAIGEL-1H (1 × 60 cm) and JAIGEL-2H (1 × 60 cm)) in series and a UV-visible detector (254 nm, JAI UV-310), and chloroform was used as the eluent. The ESI-MS spectra were recorded on a JEOL JMS-T100CS spectrometer (Akishima, Japan). The IR spectra were recorded using a JASCO Fourier Transform IR-680 spectrophotometer (Hachioji, Japan). The absorption and CD spectra were measured in a 0.1-mm quartz cell on a JASCO V-570 spectrophotometer and a JASCO J-820 spectropolarimeter, respectively. The optical rotations were taken using a JASCO P-1030 polarimeter in a 2-cm quartz cell equipped with a temperature controller (EYELA NCB-2100). The photoirradiation for trans/cis isomerization of TCC was performed on a JASCO FP-6500 spectrofluorometer with a 150 W xenon lamp. The slit width used in the experiments was 20 nm.
3. Synthetic procedures

The optically active amidine monomers $1_{\Lambda}$ and $2_{\Lambda}$ bearing a formyl and an amino group at one end, respectively, and the azobenzene-linked carboxylic acid dimer $T_{CC}$ were synthesized according to Scheme S1.

![Scheme S1](image)

**Scheme S1** Synthesis of chiral amidine monomers ($1_{\Lambda}$ and $2_{\Lambda}$) and achiral carboxylic acid template ($T_{CC}$). Reagents and conditions: (a) $p$-bromobenzaldehyde for $1_{\Lambda}$ and $p$-bromobenzylamine hydrochloride for $2_{\Lambda}$, Pd(PPh$_3$)$_4$, CuI, toluene-diisopropylamine, 65 °C. (b) Pd(PPh$_3$)$_4$, CuI, THF-Et$_3$N, ambient temperature.

**Amidine monomer $1_{\Lambda}$**. Copper (I) iodide (2.38 mg, 12.5 µmol) was added to a solution of $A$-$H^2$ (150 mg, 0.250 mmol), $p$-bromobenzaldehyde (50.8 mg, 0.275 mmol), and tetrakis(triphenylphosphine)palladium(0) (14.4 mg, 12.5 µmol) in toluene-diisopropylamine (7/3 (v/v), 15 mL) and the mixture was stirred at 65 °C for 13 h. After evaporating the solvents, the residue was purified by column chromatography (NH-SiO$_2$, CHCl$_3$/Et$_2$O = 5/1 to 5/3 (v/v)) and Bio-Beads (SX-1, CHCl$_3$) to give pure $1_{\Lambda}$ (69.4 mg, 39.3% yield) as a white solid. Mp = 87.0–90.2 °C; $[\alpha]_D^{20}$ = -104 ($c$ = 0.1 in CHCl$_3$). $^1$H NMR (500 MHz, CDCl$_3$, 25 °C, as $1_{\Lambda} \cdot (\text{CH}_3\text{CO}_2\text{H})$): δ 12.84 (br, 2H, NH), 10.03 (s, 1H, CHO), 7.88 (d, $J$ = 8.3 Hz, 2H, ArH), 7.78 (t,

7. Acceleration of the imine-bond forming reaction between 1C and 2C in the presence of 4A

(a) $k_0 = 9.35 \times 10^{-3} \text{ M}^{-1} \text{ s}^{-1}$

(b) $k_0 = 5.71 \times 10^{-2} \text{ M}^{-1} \text{ s}^{-1}$

Fig. S7 Possible mechanism for the imine-bond forming reaction between 1A (0.50 mM) and 2A (0.50 mM) or 1C (0.50 mM) and 2C (0.50 mM) in the presence of (a) 4C (1.0 mM) or (b) 4A (1.0 mM), respectively, in CDCl₃ at 25 °C.

The terminal amino groups of amidine (2A) and carboxylic acid (2C) monomers may form acid-base complexes with the carboxy groups of monomeric carboxylic acid (4C) and carboxylic acid monomer (1C) as shown in (a) and (b), respectively. The complex formation of 2A-4C will inhibit the imine-bond forming reaction, whereas the complexation of 2C-1C may induce a self-catalyzed imine-bond forming reaction, since it is well known that imine-bond forming reaction between aldehydes and amines is catalyzed by acids. Therefore, the imine-bond forming reaction in the presence of 4A underwent faster than that in the presence of 4C.
