Solvents and reagents

Materials and reagents were purchased at the highest commercially available grade and used without further purification.

Solvents used for reactions correspond to the quality “puriss”. For analytical and preparative high performance liquid chromatography (HPLC), HPLC-grade solvents were used. The water used for reactions was filtered using a Barnstead ultrapure water system.

Separation and purification methods

Reactions were monitored by thin layer chromatography (TLC) using Merck silica gel 60 F254 plates. Flash chromatography was performed using Merck silica gel 60, particle size 40-63 µm. Compounds were visualized using UV (254 and/or 366 nm) with a UV-lamp from Camag.

High performance liquid chromatography was performed on Agilent 1100 Series with UV-Vis detection.

Spectroscopic methods

$^1$H, $^{13}$C and $^{19}$F-NMR spectra were recorded (295 K) on Bruker Avance DRX-500 or DPX-400 MHz spectrometers. Solvents for NMR were obtained from Cambridge Isotope Laboratories, Inc. (Andover, MA, USA). Chemical shifts (δ) are reported in ppm using trimethylsilylane or the residual solvent peaks as a reference and coupling constants (J) are reported in Hertz (Hz). The multiplicity’s are abbreviated as: s = singlet, d = doublet, t = triplet, m = multiplet and br = broad.

The esterase activity screening and competitive displacement assays were performed using a Tecan Safire spectrophotometer using NUNC 96-well plates. The data were analyzed with gnuplot$^{S1}$ (Version 4.2) software using a least-square fitting.
Spectrometric methods

The mass spectra (MS) were recorded on an Esquire 3000 plus (Bruker) for Electron Spray Ionisation (ESI) and/or a Finnigan MAT 8400 for Fast Atom Bombardment (FAB).

High resolution mass spectrometry (HRMS) was recorded on a Bruker FTMS 4.7T BioAPEX II.

Other methods

The elemental analysis (EA) was measured on a Analysator 240 from Perkin-Elmer or a vario MICRO cube from Elementar.
Ligand-inhibitors synthesis

Compounds bispy 1 was synthesized according to literature protocols.\textsuperscript{S2}

bipy 2

\((E)-3-(4-(Methylthio)phenyl)-1-(pyridin-2-yl)prop-2-en-1-one\) (21)

To 4-(methylthio)benzaldehyde (5.61 mL, 42.0 mmol, 1.1 eq) in a 1.0 M aqueous solution of NaOH (30 mL) and MeOH (90 mL), 2-acetylpyridine (4.49 mL, 40.0 mmol, 1.0 eq) was added. After 3 h of stirring at room temperature, the solution was stored at 4 °C overnight. The yellow precipitate was filtered and washed with H\textsubscript{2}O and cold MeOH. The solvent was removed under reduced pressure. The isolated product was recrystallized from MeOH to obtain 21 (5.30 g, 20.8 mmol, 52%) as a yellow-green solid.

TLC: \(n\)-hexane/EtOAc (1/1); \(R_f\) = 0.51.

mp 86.1 °C

S5
2-(6-Ethoxy-4-(methylthio)phenyl)-5,6-dihydro-2H-pyran-2-yl)pyridine (22)

Compound 21 (2.0 g, 7.8 mmol, 1.0 eq) and yttrium (III) hexafluoroacetylacetanoate (0.10 g, 0.1 mmol, 0.02 eq) were dissolved in THF (40 mL) and 4 Å molecular sieves (2 g) were added. Ethyl vinyl ether (7.5 mL, 78.3 mmol, 10.0 eq) was added, and the reaction was stirred under nitrogen at room temperature for 3 days. The sieves were removed by filtration over celite. The solvent was removed under reduced pressure, and the brown oil was purified by flash gel chromatography (n-hexane/EtOAc, 3/1) to obtain 22 (1.87 g, 5.7 mmol, 73%) as a colorless oil.

**TLC:** n-hexane/EtOAc (1/1); R_f = 0.66.

**1H NMR** (400 MHz, CD_3OD, 20 °C, δ): 8.46 (ddd, J = 4.8, 1.8, 0.9 Hz, 1H, H^13), 7.83 (td, J = 7.8, 1.8 Hz, 1H, H^11), 7.69 (dt, J = 8.0, 1.1 Hz, 1H, H^10), 7.31 (ddd, J = 7.6, 4.9, 1.2 Hz, 1H, H^12), 7.21 (m, 4H, H^2-5), 6.02 (dd, J = 2.9, 1.2 Hz, 1H, H^6), 5.28 (dd, J = 8.6, 2.0 Hz, 1H, H^7), 4.10 (dq, J = 9.6, 7.1 Hz, 1H, H^8), 3.82 (ddd, J = 9.9, 6.7, 2.8 Hz, 1H, H^5), 3.72 (dq, J = 9.6, 7.1 Hz, 1H, H^8'), 2.44 (s, 3H, H^9), 2.32 (ddd, J = 13.2, 6.8, 2.1, 1.3 Hz, 1H, H^4'), 1.84 (ddd, J = 13.2, 10.3, 8.6 Hz, 1H, H^4'), 1.25 (t, J = 7.1 Hz, 3H, H^9).

**13C NMR** (101 MHz, CD_3OD, 20 °C, δ): 153.9, 150.0, 149.8, 142.7, 138.6, 137.9, 129.1, 128.0, 124.4, 120.3, 105.6, 101.8, 65.7, 38.9, 38.4, 16.0, 15.7.

(4-(4-(Methylthio)phenyl)-2,2'-bipyridine (13)

Compound 12 (1.50 g, 4.5 mmol, 1.0 eq) was dissolved in ACN (10 mL) and H₂NOH·HCl (3.18 g, 45.7 mmol, 10.4 eq) was added. The mixture was refluxed for 6 h, during which time a yellow precipitate formed. The solution was allowed to cool to room temperature, and the ACN was removed under reduced pressure to give an orange solid. A saturated aqueous solution of NaOH/NaCl (30 mL) and CH₂Cl₂ (30 mL) were added to the solid, and the mixture was stirred vigorously until all the solid had dissolved. The organic layer was extracted with CH₂Cl₂ (3 x 20 mL), dried over Na₂SO₄, and the solvent was removed under reduced pressure. The resulting solid was washed with MeOH to yield 13 (583 mg, 2.1 mmol, 46%) as a white powder.

TLC: CH₂Cl₂/MeOH (9/1); Rₚ = 0.77.

Complex synthesis

General procedures

Procedure 1

Bipyridine derivative complexes were synthesized according a modification of the procedure published by Mann. The ligand (0.28 mmol, 2.0 eq) and the metal dimer (0.14 mmol, 1.0 eq) were dissolved in ACN (5 mL). The resulting solution was purged with nitrogen for 20 min, and then refluxed for 4 h. The volume of the reaction was reduced to 2 mL, and the resulting solid was filtered and washed with a small amount of cold ACN. The solid was dried under vacuum to afford the desired complex.

Procedure 2

The picolylamine-derivative complexes were synthesized according a modification of the procedure published by Çetinkaya. The ligand (0.28 mmol, 2.0 eq) and the metal dimer (0.14 mmol, 1.0 eq) were dissolved in EtOH (5 mL), and the resulting solution was purged with nitrogen for 20 min. The reaction mixture was refluxed for 2 h and the solvent was removed under reduced pressure. The solid was washed with a small amount of CH$_2$Cl$_2$, and dried to afford the desired complex.
Following procedure 1, compound 6 was obtained as a yellow solid (45 mg, 0.06 mmol, 49%).

$^1$H NMR (400 MHz, DMSO-$d_6$, 20 °C, $\delta$): 11.00 (d, $J = 9.9$ Hz, 1H, $H^4$), 8.87 (m, 2H, $H^9$), 8.43 (d, $J = 8.5$ Hz, 2H, $H^2$), 8.17 (m, 4H, $H^6,7$), 8.03 (d, $J = 8.5$ Hz, 2H, $H^3$), 7.66 (m, 4H, $H^1,8$), 6.27 (d, $J = 9.7$ Hz, 1H, $H^5$), 1.62 (s, 15H, $H^{10}$).

Biology

Expression of human carbonic anhydrase II in *Escherichia coli*

Plasmid encoding human carbonic anhydrase isozyme II (hCAII) and containing a T7 RNA polymerase promoter and an ampicillin resistance gene (pACA) was a generous gift from Carol Fierke, Michigan University. The construct of this plasmid has a serine residue at position 2 instead of an alanine, with no effect on protein expression or catalytic properties. A 50 mL test tube containing 15 mL of Luria-Bertani broth (LB: 10 g/L bactotryptone, 5 g/L bactoyeast extract, and 10 g/L NaCl, containing 100 µg/mL ampicillin and 34 µg/mL chloramphenicol) was inoculated with one medium-sized colony (*E. coli* BL21(DE3)pLysS transformant). After 6 to 7 h of incubation at 37 °C at 250 rpm, it was spun down (3,000 rpm, 5 min) and the cells resuspended in 60 mL of fresh LB medium in a 125 mL Erlenmeyer baffled-flask. After overnight growth at 37 °C and 250 rpm, this pre-culture was spun down (3,000 rpm, 5 min) and the cells resuspended in 20% v/v glucose. This two steps inoculum and pre-culture method allowed to reach a high cell density to inoculate the main culture. One liter minimal medium cultures (1X M9 salts, 0.4% w/v glucose, 0.2 mL of 0.3 M ZnSO₄, and 100 µg/mL ampicillin and 34 µg/mL chloramphenicol) were carried out in 3 liters Erlenmeyer baffled-flasks, and were inoculated with the pre-culture, which was prepared as described above. The temperature was kept constant at 37 °C, until induction time. Agitation was set at 250 rpm to keep the culture broth homogeneous. Cultures were incubated for 3 hours (or until OD₆₀₀ = 0.8 – 1.0), and were induced by addition of 250 µM IPTG and 450 µM ZnSO₄. The temperature of the shaker was set to 25 °C. Three hours later, 8 µg/mL phenylmethylsulfonyl fluoride (PMSF, prepared in isopropanol) was added to the culture broth, to inhibit serine proteases growth. After additional growth for 3 h at 25 °C, cells were harvested (4,400 rpm, 4 °C for 15 min). Cells were lysed by activating the gene encoding T7 lysozyme using three cycles of “freeze/thaw”. Lysed cells were then resuspended in 25 mL lysis buffer (50 mM Tris-SO₄, pH 8.6, 50 mM NaCl, 0.5 mM ZnSO₄, and 10 µg/mL PMSF). The resuspended cells were incubated under vigorous shaking (approx. 300 rpm) at room temperature for 1 h; DNase I (1 µg/L final concentration) was added, and cells were left for another hour under the same conditions, as previously described,
until complete digestion of nucleic acids. The resuspension was centrifuged (10,000 rpm, 45 min at 4 °C). The process (resuspension in 25 mL lysis buffer and 30 min incubation) was repeated another two times to maximise the recovery of hCA II variant. Extractions were pooled and finally, the remaining pellet was deactivated and discarded. The protein was purified to homogeneity in one-step purification by sulfonamide affinity chromatography. The column was equilibrated with activity buffer (50 mM Tris-SO$_4$, pH 8.6 and 0.5 mM ZnSO$_4$), and the enzyme was loaded onto the sulfonamide column producing agarose-bound enzyme. The column was first washed with two column volumes (CV) of activity buffer, and then with wash buffer (50 mM Na$_2$SO$_4$, 50 mM NaClO$_4$, and 25 mM Tris at pH 8.8) to remove any unbound contaminants. The bound enzyme was eluted by addition of 200 mM NaClO$_4$ and 100 mM NaCH$_3$COO, at pH 5.6, and 5 mL eluted fractions were collected. The purified variants were examined by SDS-PAGE, and protein concentrations were determined from the absorbance at 280 nm (extinction coefficient, $\varepsilon = 50,483$ cm$^{-1}$M$^{-1}$). This expression protocol yielded ~400 mg/L of pure protein (after lyophilisation) in 1 L working volume of culture in shake-flasks.

General procedure for hCA II inhibition profiling

Esterase activity screening assay

All steady-state measurements were performed according the procedure previously described.\textsuperscript{S2,S5,S7,S8}

\[ v = \frac{v_0 \cdot K_i}{K_i + ([I]_t - 0.5([I]_t + [E]_t + K_i) - \sqrt{([I]_t + [E]_t + K_i)^2 - 4 \cdot [I]_t \cdot [E]_t})} \] (1)

Figure S4: Steady-state kinetic data for the inhibition of hCA II iridium metal complexes. The initial rates of the enzyme-catalyzed hydrolysis of p-nitrophenyl acetate substrate were measured as a function of inhibitor concentration. [Enzyme] = 1 µM, [p-nitrophenyl acetate] = 0.5 mM. The solid, smooth lines are the best fits of the data according to equation 1 for the \( K_i \) of 6 (•), 7 (•), 8 (•), 10 (•).

Competitive displacement assay

All steady-state measurements were performed according the procedure previously described.\textsuperscript{S9}

\[ F_{tot} = \frac{F_{obs} - F_{ini}}{F_{end} - F_{ini}} = \frac{1}{1 + (KDNSA/[DNSA])(1+[I]/K_d)} \] (2)
Figure S5: Competitive displacement assay data for the inhibition of WT hCA II. The initial rates of the enzyme-catalyzed hydrolysis of $p$-nitrophenyl acetate substrate were measured as a function of inhibitor concentration. [Enzyme] = 1 $\mu$M, [p-nitrophenyl acetate] = 0.5 mM. The solid, smooth lines are the best fits of the data according to equation 2 for the $K_d$ of 9 (●).
Catalysis

Lyophilized hCA II corresponding to 0.4 mM final concentration of free binding sites (~2.5 mg) was weighed into vials. The reaction buffer (MOPS 1.2 mM buffer, 3 M sodium formate, pH 7.5, 200 µL) was added, and the mixture was stirred until all the protein was dissolved. The metal complex stock solution was added (final concentration 0.3 mM; 0.8 equivalents [Ru] or [Ir] vs. hCA II free binding sites), and the mixture was stirred for 30 minutes. Finally, the substrate stock solution was added (4 µL, final concentration 20 mM). The tubes were placed in a magnetically stirred multireactor, and were heated up to 40 °C if required.\textsuperscript{S10}

Michaelis-Menten kinetics

Reaction setup\textsuperscript{S11}

Human Carbonic Anhydrase II (~2.5 mg, final concentration: 0.4 mM hCA II) was dissolved in a MOPS/formate solution (100 µL, pH 7.5, 0.4 mM and 3 M respectively) and [Ir] catalyst (8.75 µL of DMSO stock solution, final concentration: 0.35 mM [Ir]) was added. The resulting ATHase solution was mixed for 15 min at 25 °C (100 rpm). Reactions were started by adding an appropriate volume of the substrate stock solution (100 µL, final concentration between 150 and 1 mM) to the tubes. After 20, 40 and 60 minutes, respectively, reaction aliquots (50 µL) were removed and added to a gluthathione solution (40 µL, 0.25 M) to stop the catalytic reaction.

Work up and analysis

Water (300 µL) was added to aliquots, and HPLC sample were prepared by adding 200 µL of the previous solution in water (500 µL). Conversions were determined using an Eclipse XDB-C18 column (5 µm, 4.6 x 150 mm) and water/MeOH/TFA 87:13:0.1 as an eluent at a flow of 1 ml/min and 25°C (t\textsubscript{R} 6,7-dimethoxy-1-methyl-1,2,3,4-tetrahydroisoquinoline = 11.9 min, t\textsubscript{R} 1-methyl-6,7-dimethoxy-3,4-dihydroisoquinoline = 16.3 min). The response factor used for the conversion determination is 1.26 at 280 nm.
X-ray structure

Crystallization

Crystals of ligand-free carbonic anhydrase II were obtained by hanging drop vapor diffusion technique. A volume of 3.2 µL of crystallization buffer (2.6 M (NH₄)₂SO₄, 50 mM Tris-SO₄, pH 7.9) was mixed with 0.8 µL of protein solution (20 mg/mL human Carbonic Anhydrase II, 50 mM Tris-SO₄, 1 mM 4-chloromercuribenzoic acid, pH 7.9). The droplet was equilibrated against a reservoir of 500 µL crystallization buffer at 293 K. Protein crystals grew within 24 hours. For the subsequent ligand soaking, ligand-free Carbonic Anhydrase II crystals were cross-linked in an atmosphere of 25% aqueous glutaraldehyde for 15 minutes using hanging-drop vapor diffusion technique as described by Lusty et al. Cross-linked crystals were transferred into a ligand solution (0.1 mM 9, 0.5% DMSO, 2.6 M (NH₄)₂SO₄, 50 mM Tris-SO₄, pH 7.9) and soaked for 1 hour at 293 K. Soaked crystals were shock-frozen in liquid nitrogen.

Data Collection and Structure Solution

Diffraction data of soaked hCA II crystals were collected at the Swiss Light Source (SLS) beamline PXIII at a wavelength of 1.0000 Å and a temperature of 100 K to a resolution of 1.31 Å. The reflections were indexed, processed and scaled using software XDS and XSCALA. The structure was solved by molecular replacement (software PHASER) using as a model the structure with PDB code 3PKY devoid of all ligand and water molecules. Software phenix.refine (PHENIX package) was used for the structure refinement. Geometry restraints for complex 9 were obtained from a related structure in the Cambridge Structural Database (CSD code SIFLOJ). Coordinates and restraints were adapted using program REEL (PHENIX package). Electron densities and structures were visualized using software COOT. Figures were drawn with PYMOL.

Overall structure, 4-chloromercuribenzoic acid and water binding sites

The molecular replacement procedure yielded one molecule of hCA II in the asymmetric unit of the monoclinic crystal. As observed previously,⁵² the first two C-terminal residues could not be refined, probably due to the high flexibility of the C-terminus. In close proximity to Cys206 strong signals of difference density were detected in the F₀-Fₐ omit map (30 σ) and in the anomalous difference density map (20 σ). In analogy to a structure solved earlier,⁵¹⁰ the 4-chloromercuribenzoic acid of the buffer solution was modeled in this position. Finally, a total of 167 water and two glycerol molecules were modeled in the structure.
Figure S6: Close up view of the proposed *anticlinal* ligand conformation in the iridium-free A THase $9 \subset hCA$ II. The electron density of the $F_o-F_c$ omit map (gray color) and the anomalous difference density (green color) are contoured at $3\sigma$ and $4\sigma$, respectively (as also shown in Figure 3).

Figure S7: Qualitative model of substrate (orange) binding to A THase $9 \subset hCA$ II based on the X-ray structure. Residues of the presumed substrate-binding site that are potential targets for genetic optimization are colored in green.
