Figure S1. In-gel fluorescence analysis of avidin treated with O-NBD or N-NBD compounds (fluorescence image at 530 nm after excitation at 488 nm). Labeling conditions: 1 μM avidin, 1 μM compound, 25 mM phosphate buffer, pH 7.0, 0 °C, and 1 h. Comments: No labeling was observed when avidin was treated with O-NBD compounds lacking the ligand unit.

Figure S2. In-gel fluorescence analysis of avidin treated with O-NBD probes in the absence or presence of biotin (fluorescence image at 530 nm after excitation at 488 nm). Labeling conditions: 1 μM avidin, 1 μM O-NBD probe, 25 mM phosphate buffer, pH 7.0, 0 °C, and 1 h. In lanes 3–5, 7–9, and 11–13, avidin was preincubated with 1–100 μM biotin for 1 h at 0 °C before addition of O-NBD probe. Comments: Pretreatment with 1 equivalent of biotin completely blocked the labeling.

Figure S3. In-gel fluorescence analysis of a mixture of avidin and BSA treated with biotin O-NBD probes (fluorescence image at 530 nm after excitation at 488 nm). Labeling conditions: 1 μM avidin, 1 μM BSA, 1 μM biotin O-NBD probe, 25 mM phosphate buffer, pH 7.0, 0 °C, for 1 h. Comments: Selective labeling of avidin was achieved in the presence of a non-target protein, BSA, which contains about sixty lysine residues. The probes having ethylene glycol linkers (C8EG, C11EG and C14EG) exhibited extremely high target-selectivity (>99.9%).
Figure S4. In-gel fluorescence analysis of a mixture of avidin and BSA treated with O-NBD probes at 0 °C or room temperature (fluorescence image at 530 nm after excitation at 488 nm). Labeling conditions: 1 μM avidin, 1 μM BSA, 1 μM O-NBD probe, 25 mM phosphate buffer, pH 7.0, 0 °C or room temperature (23 °C), for 1 h.
Comments: Increase in the labeling temperature from 0 °C to room temperature resulted in faster labeling, but did not reduce the target-selectivity.

Figure S5. Absorption spectra of 10 μM avidin (black), 10 μM C14EG (purple) and 10 μM NBD-NHMe (green) in 25 mM phosphate buffer (pH 7.0).
Comments: The absorbance of NBD-NHMe at 478 nm was found to be 0.244.
Figure S6. (a) Time course of the absorbance at 478 nm. Conditions for blue squares: 10 μM avidin, 10 μM C14EG, 25 mM phosphate buffer, pH 7.0, and room temperature. Conditions for red squares: 10 μM C14EG, 25 mM phosphate buffer, pH 7.0, and room temperature. Conditions for black circles: 10 μM avidin, 25 mM phosphate buffer, pH 7.0, and room temperature. Conditions for purple triangles: 10 μM avidin (preincubated with 100 μM biotin for 1 h at room temperature before addition of C14EG), 10 μM C14EG, 25 mM phosphate buffer, pH 7.0, and room temperature. Absorbance of a mixture of avidin and C14EG at 478 nm: 0.019 (5 min), 0.066 (30 min), 0.101 (1 h), 0.134 (2 h), 0.152 (3 h), 0.171 (4 h), 0.175 (5 h), 0.182 (9 h), 0.185 (12 h), and 0.190 (24 h). (b) Plots of the reaction time versus Ln C (concentration of C14EG (M)): 10 μM avidin, 10 μM C14EG, 25 mM phosphate buffer, pH 7.0, and room temperature. Concentration of C14EG was calculated from UV absorbance at 478 nm, regarding “absorbance = 0.185 (absorbance at 12 h)” as full conversion.

Comments: The labeling yield was calculated based on the absorbance at 478 nm. For example, the labeling yield after 12 h was found to be 76% (0.185/0.244). According to the supplier’s data sheet, avidin used in our experiments has ~ 80% biotin-binding activity (12 units/mg). This would be a key reason to why the maximum labeling yield was 78% (after 24 h). The reaction rate constant of avidin and C14EG at room temperature (23 °C) was found to be 0.78/h.

Figure S7. Enlarged MS/MS spectrum from ion at m/z 863.86 (see also Figure 4c). The labeling of avidin was carried out under the following conditions: 1 μM avidin, 1 μM C14EG, 25 mM phosphate buffer, pH 7.0, 0 °C, for 1 h. Main fragmentation series (y-carboxy and b-amino) are indicated. The details are summarized in Table S1.

Comment: The MS/MS analysis identified the labeled amino acid residue as K111, which is located near the biotin binding-site.

Figure S8. LC-LIF-MS analysis of trypsin digests of avidin labeled with C8 (left) or C11EG (right). Labeling of avidin was carried out under the following conditions: 1 µM avidin, 1 µM O-NBD probe, 25 mM phosphate buffer, pH 7.0, 0 °C, and 1 h. The labeled avidin was subjected to in-gel tryptic digestion and analyzed by LC-LIF-MS. Chromatograms monitored by total ion current (TIC) (top), extracted ion in the range of m/z 863.80–863.95, corresponding to N-NBD-[Ser101-Arg114] (middle), and laser-induced fluorescence (LIF) detector (bottom, λ<sub>ex</sub> = 473 nm, λ<sub>em</sub> = 500–600 nm). The delay time from the fluorescence chromatogram to the ion chromatogram was determined to be 1.4 min by using authentic fluorescent peptides.

Comments: Avidin labeled with C8 (or C11EG) exhibited a single peak in the LIF chromatogram. We analyzed this peak (MS/MS analysis), and identified the NBD-modified peptide residue as K111 [SSVNDIGDDWK<sup>111</sup>(N-NBD)ATR].
Figure S9. Time-dependent spectral change of NBD-OMe: 10 μM NBD-OMe in 25 mM phosphate buffer (pH 7.0) after 0 min (red), 5 h (yellow), 24 h (green), 54 h (light blue), and 69 h (navy blue).
Comments: NBD-OMe was slightly hydrolyzed in phosphate buffer after 69 h at room temperature.

Figure S10. Time-dependent spectral change of NBD-OMe in the presence of imidazole: 10 μM NBD-OMe and 10 mM imidazole in 25 mM phosphate buffer (pH 7.0) after 3 h (green), 19 h (light blue), and 43 h (blue). The absorption spectrum of NBD-OMe is shown by a red line.
Comments: Almost no reaction took place when imidazole was added to NBD-OMe, although the hydrolysis of NBD-OMe seemed to be slightly accelerated.

Figure S11. Time-dependent spectral change of NBD-OMe in the presence of 3-methylindole: 10 μM NBD-OMe and 10 mM 3-methylindole in 25 mM phosphate buffer (pH 7.0) after 1 min (yellow), 3 h (green), and 19 h (light blue). The absorption spectrum of NBD-OMe is shown by a red line.
Comments: Almost no reaction took place when 3-methylindole was added to NBD-OMe, although the hydrolysis of NBD-OMe seemed to be slightly accelerated.
Figure S12. Time-dependent spectral change of NBD-OMe in the presence of \( p \)-cresol: 10 \( \mu \)M NBD-OMe and 10 mM \( p \)-cresol in 25 mM phosphate buffer (pH 7.0) after 1 min (yellow), 3 h (green), 19 h (light blue), and 43 h (blue). The absorption spectrum of NBD-OMe is shown by a red line.

Comments: No reaction took place when \( p \)-cresol was added to NBD-OMe.

Figure S13. (a) Time-dependent spectral change of NBD-OMe in the presence of 1-propanethiol: 10 \( \mu \)M NBD-OMe and 10 mM 1-propanethiol in 25 mM phosphate buffer (pH 7.0) after 3 h (green), 15 h (light blue), and 24 h (blue). The absorption spectra of NBD-OMe and NBD-SEt are shown by red and ocher lines, respectively. (b) Time-dependent spectral change of NBD-OMe in the presence of 1-propanethiol at pH 6.0 or 8.0: 10 \( \mu \)M NBD-OMe and 10 mM propanethiol in 25 mM phosphate buffer (pH 6.0 or 8.0).

Comments: No reaction took place when 1-propanethiol was added to NBD-OMe, although the hydrolysis of NBD-OMe seemed to be slightly accelerated under basic conditions (pH 8.0).
**Figure S14.** (a) Time-dependent spectral change of NBD-OMe in the presence of 1-propylamine: 10 μM NBD-OMe and 10 mM propylamine in 25 mM phosphate buffer (pH 7.0) after 1 h (yellow), 6 h (green), 22 h (light blue), and 41 h (blue). The absorption spectra of NBD-OMe and NBD-NHMe are shown by red and black lines. (b) Plots of the reaction time versus Ln C (concentration of NBD-OMe (M)). Conditions: 10 μM NBD-OMe and 10 mM propylamine in 25 mM phosphate buffer (pH 7.0) at room temperature. The concentration of NBD-OMe was calculated from UV absorbance at 478 nm regarding “absorbance = 0.244” as full conversion (see also Figure S5). (c) Time course of the UV absorbance at 478 nm of the mixture of NBD-OMe and 1-propylamine. Conditions: 10 μM NBD-OMe, 10 mM 1-propylamine, 25 mM phosphate buffer, pH 6.0 (blue squares) or pH 8.0 (green triangles), and room temperature.

Comments: 1-Propylamine (1000 equiv.) slowly reacted with NBD-OMe to give amino NBD at pH 7.0. The reaction yield after 6 h was calculated to be 6.8% based on the absorbance at 478 nm. The reaction rate constant of NBD-OMe and 1-propylamine at pH 7.0 was found to be 0.0082/h (pseudo-first-order reaction). The reaction was accelerated under basic conditions (pH 8.0).

**Figure S15.** In-gel fluorescence analysis of avidin treated with C14EG at different pH values (fluorescence image at 530 nm after excitation at 488 nm). Labeling conditions: 1 μM avidin, 1 μM C14EG, 25 mM phosphate buffer, pH 6.0–8.0, 0 °C, and 1 h.

Comments: The labeling of avidin was accelerated under basic conditions, suggesting that deprotonation of K111 (-NH$_3^+$, amine salts) is involved in the labeling event.
Figure S16. Scatchard plot and saturation curve of specific[^3^H]PK11195 binding to mouse kidney mitochondria. Assays were carried out utilizing 0.25–20 nM[^3^H]PK11195. Non-specific binding was measured in the presence of 1 μM PK11195. Data are averages of the three experiments.
Comments: The $K_d$ value of PK11195 was found to be 1.4 nM.

Figure S17. Displacement of[^3^H]PK11195 binding in mouse kidney mitochondria. Bound radioactivity is shown as a percentage of specific binding in the absence of competitor. Data points represent the means ± SEM of triplicate determinations. IC$_{50}$ values (nM): 4.4 (1), 9.8 (2), 1.7 (3), 1.9 (PK11195).

The $K_i$ values were derived from IC$_{50}$ values in accordance with the equation of Cheng and Prusoff (see below).

$K_i = \frac{IC_{50}}{1 + \frac{L}{K_d(L)}}$

$L$: concentration of [3H]PK11195 (0.5 nM)

$K_d(L)$: $K_d$ of PK11195 (1.4 nM)

Figure S18. In-gel fluorescence analysis of mouse kidney mitochondria labeled with 2-ONBD or 3-ONBD in the absence/presence of 1 (fluorescence image at 530 nm after excitation at 488 nm). Labeling conditions: 0.15 mg/mL mitochondria, 5 μM O-NBD probe, ± 1 (5, 50 and 500 μM), 5 mM Hepes-KOH, pH 7.2, 210 mM mannitol, 70 mM sucrose, 1 mM EGTA, 30 °C, for 1 h. In the competition analysis, the mitochondria were preincubated with 1 for 10 min before addition of O-NBD probes.

Comments: Labeling of 70, 32 and 28 kDa bands was inhibited by 1 in a dose-dependent manner, suggesting that these bands were specifically labeled in response to the target-ligand interactions. Although the use of 500 μM 1 completely inhibited the labeling, we observed precipitation of 1. Thus, this condition was not used for competition analyses.
Figure S19. 2-D PAGE analysis of labeled mitochondria. Mitochondria labeled with 3-ONBD were subjected to 2-D PAGE and visualized with an in-gel fluorescence imager (upper left) and by CBB staining (lower left). Labeling conditions: 5 μM 3-ONBD, 0.15 mg/mL mouse kidney mitochondria, 5 mM Hepes-KOH, pH 7.2, 210 mM mannitol, 70 mM sucrose, 1 mM EGTA, 30 °C, and 1 h. The upper right gel shows mitochondria labeled with 5 μM 3-ONBD in the presence of 50 μM 1. The lower right gel shows mitochondria not treated with any probe. The fluorescent spots encircled in red indicate autofluorescent proteins of mouse kidney mitochondria.

Comments: The spots circled in yellow almost completely disappeared after pretreatment with 50 μM 1. Therefore, these fluorescent spots show specifically labeled proteins. Meanwhile, fluorescent spots around 40–55 kDa were not affected by pretreatment of 1 (see upper gels), thus, these spots show non-specifically labeled proteins. However, it is also obvious that these 40–55 kDa fluorescent spots contain abundant proteins of mouse kidney mitochondria as seen from the CBB stained gel (lower left gel). Thus, it is confirmed that 3-ONBD selectively labels 32 kDa proteins (spots 1–6).
Table S3. Proteins identified from the fluorescent spots 1–9 (Figure S19, upper left gel). Each spot was subjected to in-gel tryptic digestion and analyzed by LC-MS. The identified proteins were ranked by ion score. The proteins in the top 5 or showing over 60% sequence coverage are listed. VDACs are indicated in blue.

Comments: VDACs are the only proteins that exist in all specifically labeled spots (Figure S19, upper left gel, spots 1–6). In addition to this result, Figure S20 indicated that 3-ONBD selectively labeled VDACs, partner proteins of TSPO. The autofluorescent spots 7–9 were found to contain flavoproteins or cytochromes.

Comments: VDACs and ANTs were found from the 32 kDa and 28 kDa bands, respectively. However, after careful 2-D PAGE separation, 28 kDa fluorescent spots were not observed (Figure 6b, Figure S19 and Table S3). For this reason, it remains unclear whether 3-ONBD has labeled ANTs. The 70 kDa band contained several mitochondrial membrane proteins. Although we could not find connections between these proteins and TSPO, the result might suggest that the 70 kDa band contains PIGA-interacting protein(s).
**Figure S20.** In-gel fluorescence analysis of VDACs purified from the labeled mitochondria (fluorescence image at 530 nm after excitation at 488 nm). The labeled mitochondria (lanes 1–3) and purified VDACs (lanes 4–6) are shown. Labeling condition: 5 µM **3-ONBD**, 0.15 mg/mL mouse kidney mitochondria, 5 mM Hepes-KOH (pH 7.2), 210 mM mannitol, 70 mM sucrose, 1 mM EGTA, 30 °C, and 1 h. In the competition analysis, the mitochondria were preincubated with 50 µM **I** for 10 min. VDACs were then purified from the labeled mitochondria according to the reported VDAC-purification method. Initially, the labeled mitochondria were disrupted by freeze-thaw and centrifuged at 15,000 g for 10 min. The pellet was resuspended in VDAC purification buffer (10 mM Tris-HCl (pH 7.4), 1 mM EDTA, 3% Triton X-100, 0.1 mM PMSF, 0.5 µg/mL leupeptin). After inverting for 30 min at 4 °C and centrifugation at 32,000 g for 1 h, the obtained supernatant was loaded to a hydroxyapatite/cerite (10:1 w/w) column. The endogenous VDAC in the unbound fractions was analyzed by SDS-PAGE. Western blotting analysis was performed using mouse monoclonal antibody to VDAC1 (abcam).

Comments: Mouse kidney mitochondria were labeled by **3-ONBD** under the general conditions, and the labeled mitochondria were purified according to the VDAC-isolation protocol and analyzed by SDS-PAGE. The result revealed that **3-ONBD** selectively labeled VDACs in response to PIGA-target interactions.
**Figure S21.** In-gel fluorescence analysis of HEK293T cells labeled with 3-ONBD (fluorescence image at 530 nm after excitation at 488 nm). Labeling condition: 5 μM 3-ONBD, 37 °C, for 1.5 h. In the competition analysis, the cells were preincubated with 125 μM 1 for 0.5 h at 37 °C. The labeled cells were lysed with solubilization buffer (20 mM Hepes–Na (pH 7.0), 1 mM EDTA, 0.5% Triton X-100, and complete mini (Roche, 1 tablet/10 mL)) and analyzed by SDS-PAGE.

Comments: The 32 and 28 kDa proteins were specifically labeled by 3-ONBD, and the labeling was subject to competition by 1. The 70 kDa protein was also labeled. In labeling experiments using HEK293T mitochondria, we identified heat shock proteins (HSPs) from the 70 kDa band. Recently, cytosolic chaperones have been suggested to be involved in the transportation of TSPO from cytosol to mitochondria. Our O-NBD probe 3-ONBD might also label this putative TSPO-HSP complex, although this remains to be confirmed.

**Figure S22.** Mitochondrial localization of 2. HEK293T cells were preincubated with 12.5 nM MitoTracker Red CMXRos for 30 min before addition of 2.5 μM 2. After incubation at 37 °C for 1 h, fluorescent images were obtained. Fluorescence images of N-NBD (left, Ex. 488 nm, Em. 493-548 nm) and MitoTracker Red CMXRos (middle, Ex. 561 nm, Em. 578-678 nm) are shown. The merged image is also presented with the bright field image (right).

Comments: The known fluorescent TSPO ligand 2 was mainly localized in mitochondria. However, as compound 2 itself is fluorescent, in addition to the fluorescence signals from TSPO-binding probe at mitochondria, signals of the free probe at other hydrophobic parts of the cells were also observed. In contrast, 3-ONBD clearly labeled mitochondria possibly because only the PIGA-interacting proteins were labeled with turn-ON fluorescence (Figure 7).
S16

Figure S23. TSPO knockdown by siRNA (see also Supplementary Methods). HEK293T cells were transfected with 40 nM Stealth RNAi, TSPO-HSS141398 (lanes 6 and 7) or TSPO-HSS186329 (lanes 8 and 9), before the labeling with 3-ONBD. Negative Universal control Med was used as a negative control (lanes 4 and 5). After labeling with 0.5 μM 3-ONBD for 1.5 h, the cells were lysed and analyzed. In competition analysis, the cells were preincubated with 87.5 μM 1 for 0.5 h before an addition of 3-ONBD.

Comments: The cells treated with 3-ONBD showed decreased VDAC1 (lane 2). In contrast, TSPO silencing increased VDAC1 expression level (lanes 6–9) as reported previously, and the treatment of TSPO ligand 1 for 2 h resulted in up-regulation of TSPO and VDAC1 (lanes 3, 5, 7 and 9). Although these experimental facts made quantitative analysis of TSPO-VDAC1 complex difficult, the treatment of both siRNA and compound 1 notably inhibited the labeling of 32 kDa proteins (lanes 7 and 9).

Figure S24. Fluorescence spectra of NBD-NHMe (left: λex 478 nm) and NBD-SEt (right: λex 431 nm). Conditions: 10 μM compound in 25 mM phosphate buffer.

Comments: The fluorescence maximum of NBD-NHMe appeared at 550 nm by an excitation at 478 nm (left). In contrast, NBD-SEt showed no fluorescence under the same conditions (data not shown). The fluorescence spectrum of NBD-NHMe is unaffected by pH values within the range of 6.0–8.0 (25 mM phosphate buffer, pH 6.0–8.0). NBD-SEt showed a weak fluorescence at 529 nm by excitation at 431 nm (right). These results are well accorded with the reported results. Alkoxy NBDs, including O-NBD probes and NBD-OMe, showed no fluorescence as reported previously. Photophysical properties (molecular extinction coefficients, fluorescent quantum yields) of NBD-NHMe, NBD-SMe and NBD-OMe have also been reported. It is confirmed that the extinction coefficient of NBD-NHMe is similar to the reported value (observed: 24400, reported: 23000).

**Synthetic Procedure**

**General Information**

All chemicals and reagents were purchased from Sigma-Aldrich Co., LLC, Kanto Chemical Co., Inc., Tokyo Chemical Industry Co., Ltd., Acros Organics or Wako Pure Chemical Industries, Ltd., and used without further purification. Reactions were performed under an atmosphere of nitrogen, unless noted otherwise, and monitored by thin-layer chromatography (TLC, Merck silica gel 60 F254) plates. Bands were visualized using UV light or appropriate reagents followed by heating. Flash chromatography was carried out with silica gel (Silica gel 60N, 40–50 μm particle size) purchased from Kanto Chemical Co., Inc. NMR spectra were recorded on a JEOL JNM-AL400 or ECP400 spectrometer, operating at 400 MHz for \(^1\)H-NMR and at 100 MHz for \(^13\)C-NMR. Proton and carbon chemical shifts were referenced to residual solvent peaks.\(^{57}\) High-resolution mass spectra were obtained using a Bruker microTOF-Q II-RSL mass spectrometer. Melting points were determined by using a Yanagimoto hot-stage melting point apparatus.

Synthesis of NBD-OMe (4) (Compound 4 was prepared by a different method from the reported procedure.\(^{56a}\))

MeOH (2.2 μL, 55 μmol) and N,N-diisopropylethylamine (9.5 μL, 55 μmol) were added to a solution of NBD-F (10 mg, 55 μmol) in anhydrous CH₂Cl₂ (1.5 mL), and the mixture was stirred for 24 h at room temperature. After removal of the solvent, the residue was purified by preparative TLC (CHCl₃) to afford the product NBD-OMe (8.5 mg, 80%) as a yellow solid.

NBD-OMe: \(^1\)H NMR (400 MHz, CDCl₃) \(\delta\) 4.24 (s, 3H), 6.71 (d, \(J = 8.4\) Hz, 1H), 8.56 (d, \(J = 8.4\) Hz, 1H); \(^13\)C NMR (100 MHz, CDCl₃) \(\delta\) 57.9, 104.0, 130.1, 134.1, 144.1, 145.3, 155.5; HRMS (ESI) Calcd. for C₇H₅N₃O₄Na: 218.0172, Found 218.0181.

Synthesis of 5

1-Octanol (15 μL, 0.27 mmol) and N,N-diisopropylethylamine (16 μL, 0.27 mmol) were added to a solution of NBD-F (18 mg, 0.27 mmol) in anhydrous CH₂Cl₂ (1.5 mL), and the mixture was stirred for 17 h at room temperature. After removal of the solvent, the residue was purified by preparative TLC (CHCl₃) to afford the product 5 (24 mg, 83%) as a yellow solid.

N-Hydroxysuccinimide (52 mg, 0.45 mmol) and N-(3-dimethylaminopropyl)-N-ethylcarbodiimide hydrochloride (120 mg, 0.61 mmol) were added to a solution of biotin (100 mg, 0.41 mmol) in anhydrous DMF (1.5 mL), and the mixture was stirred for 11 h at room temperature. N,N-Diisopropylethylamine (210 µL, 1.2 mmol) and 2-ethanolamine (27 µL, 0.45 mmol) were then added, and stirring was continued for 3 h. The solvent was removed under reduced pressure, and the residue was taken up in CH₂Cl₂. Filtration afforded a white solid, which was washed with CH₂Cl₂ to give the product 7 (79 mg, 67%) as a white solid.

8: 1H NMR (400 MHz, CDCl₃/CD₃OD, 10:1) δ 1.34 (tt, J = 7.3, 7.3 Hz, 2H), 1.47–1.68 (m, 4H), 2.13 (t, J = 7.4 Hz, 2H), 2.63 (d, J = 12.8 Hz, 1H), 2.82 (dd, J = 4.8, 12.8 Hz, 1H), 2.99–3.10 (m, 2H), 3.54 (t, J = 4.8 Hz, 2H); 13C NMR (100 MHz, CDCl₃/CD₃OD, 10:1) δ 25.4, 27.9, 28.2, 35.6, 40.3, 41.9, 55.6, 60.2, 61.0, 61.8, 164.3, 174.8; HRMS (ESI) Calcd. for C₁₂H₂₁N₃O₃SNa: 310.1196, Found 310.1195.

Synthesis of C2

N,N-Diisopropylethylamine (73 µL, 0.41 mmol) and NBD-F (38 mg, 0.21 mmol) were added to a solution of 7 (20 mg, 70 µmol) in anhydrous DMF (1.0 mL), and the mixture was stirred for 33 h at room temperature. The solvent was removed under reduced pressure, and the residue was purified by silica gel column chromatography (CHCl₃/MeOH, 10:1 to 8:1), followed by preparative TLC (CHCl₃/MeOH, 10:1), to afford the product C2 (17 mg, 53%) as a light brown solid. The starting 7 was recovered in 35% yield. C2: 1H NMR (400 MHz, CDCl₃/CD₃OD, 10:1) δ 1.22 (tt, J = 7.7, 7.7 Hz, 2H), 1.33–1.56 (m, 4H), 2.06 (t, J = 7.6 Hz, 2H), 2.50 (d, J = 13.2 Hz, 1H), 2.68 (dd, J = 5.0, 13.0 Hz, 1H), 2.89–2.96 (m, 1H), 3.57 (t, J = 5.2 Hz, 2H), 4.09 (dd, J = 4.6, 8.2 Hz, 1H), 4.29 (t, J = 5.4 Hz, 2H), 4.26–4.33 (m, 1H), 6.69 (d, J = 8.8 Hz, 1H), 8.42 (d, J = 8.4 Hz, 1H); 13C NMR (100 MHz, CDCl₃/CD₃OD, 10:1) δ 25.2, 27.9, 28.2, 35.3, 38.0, 40.0, 55.4, 60.1, 61.9, 69.4, 105.1, 129.6, 134.6, 143.9, 145.2, 154.2, 174.8 (The 13C signal of the urea, around 164 ppm, was not observed.); HRMS (ESI) Calcd. for C₁₈H₂₂N₆O₆SNa: 473.1214, Found 473.1212.

Synthesis of 8 (Compound 8 was prepared by a different method from the reported procedure.)

N-Hydroxysuccinimide (52 mg, 0.45 mmol) and N-(3-dimethylaminopropyl)-N-ethylcarbodiimide hydrochloride (120 mg, 0.61 mmol) were added to a solution of biotin (100 mg, 0.41 mmol) in anhydrous DMF (1.5 mL), and the mixture was stirred for 3 h at room temperature. N,N-Diisopropylethylamine (210 µL, 1.2 mmol) and 2-(2-aminoethoxy)ethanol (45 µL, 0.45 mmol) were then added, and stirring was continued for 14 h. Sodium azide (590 mg, 9.1 mmol) was added to a solution of 2-[2-(2-chloroethoxy)ethoxy]ethanol (770 mg, 4.5 mmol) in water (2.2 mL), and the mixture was stirred for 27 h at 75 °C. After removal of the solvent under reduced pressure, Et2O was added, and the resulting suspension was filtered. The filtrate was concentrated under reduced pressure to afford the product 10 (770 mg, 97%) as a colorless oil. 10: 1H NMR (400 MHz, CDCl3) δ 2.24 (br-s, 1H), 3.40 (t, J = 5.0 Hz, 2H), 3.61 (t, J = 4.6 Hz, 2H), 3.65–3.71 (m, 6H), 3.74 (t, J = 4.6 Hz, 2H); 13C NMR (100 MHz, CDCl3) δ 50.8, 61.9, 70.2, 70.5, 70.8, 72.6.

Synthesis of 11 (Compound 11 was prepared by a small modification of a known procedure.\textsuperscript{S12})

Triphenylphosphine (300 mg, 1.3 mmol) was added to a solution of 10 (200 mg, 1.1 mmol) in THF (5 mL), and the mixture was stirred for 19 h at room temperature. Water (62 µL, 3.4 mmol) was added to the mixture, and stirring was continued for 10 h. The solvent was removed under reduced pressure, and water was added to the residue. The aqueous solution was then washed with toluene, and concentrated under reduced pressure to afford the product 11 (160 mg, 95%) as a colorless oil. 11: 1H NMR (400 MHz, CD3OD) δ 2.81 (t, J = 5.2 Hz, 2H), 3.54 (t, J = 5.4 Hz, 2H), 3.58 (t, J = 4.6 Hz, 2H), 3.61–3.71 (m, 6H); 13C NMR (100 MHz, CD3OD) δ 42.0, 62.2, 71.3, 71.4, 73.2, 73.7.

Synthesis of 12 (Compound 12 was prepared by a different method from the reported procedure.\textsuperscript{S13})

N-Hydroxysuccinimide (52 mg, 0.45 mmol) and N-(3-dimethylaminopropyl)-N-ethylcarbodiimide hydrochloride (120 mg, 0.61 mmol) were added to a solution of biotin (100 mg, 0.41 mmol) in anhydrous DMF (1.5 mL), and the mixture was stirred for 27 h at room temperature. N, N-Diisopropylethylamine (430 µL, 2.5 mmol) and 11 (67 mg, 0.45 mmol) were added, and stirring was continued for 13 h. The solvent was removed under reduced pressure, and the residue was purified by silica gel column chromatography (MeOH/CH2Cl2, 1:10 to 1:5) to afford the product 12 (100 mg, 67%) as a white solid. 12: 1H NMR (400 MHz, CDCl3/CD3OD, 20:1) δ 1.31–1.40 (m, 2H), 1.51–1.72 (m, 4H), 2.16 (t, J = 7.6 Hz, 2H), 2.68 (d, J = 13.2 Hz, 2H), 2.83 (dd, J = 4.8, 13.2 Hz, 1H), 3.02–3.11 (m, 1H), 3.32–3.38 (m, 2H), 3.47–3.59 (m, 8H), 3.64–3.69 (m, 2H), 4.25 (dd, J = 4.4, 7.6 Hz, 1H), 4.45 (dd, J = 5.0, 7.8 Hz, 1H), 6.5 (br-s, 1H), 7.22 (t, J = 5.2 Hz, 1H); HRMS (ESI) Calcd. for C16H29N3O5SNa: 398.1720, Found 398.1710.

**Synthesis of 14 and 15** (Compound 14 was prepared by a small modification of a known procedure).
Triethylamine (0.86 mL, 6.2 mmol) was added to a solution of tetraethylene glycol (0.89 mL, 5.2 mmol) in anhydrous CH₂Cl₂ (10 mL). After cooling to 0 °C, methanesulfonyl chloride (0.32 mL, 4.1 mmol) was added dropwise to the solution, and the mixture was stirred for 1 h at 0 °C and for 1 h at room temperature. The reaction mixture was then washed with 2 N HCl and brine, and dried over Na₂SO₄. The solvent was removed under reduced pressure. The residue was then dissolved in DMF (2.0 mL), and sodium azide (301 mg, 4.6 mmol) was added. The mixture was stirred at 80 °C for 12 h, and the solvent was removed under reduced pressure. Et₂O was added to the residue, and the resulting suspension was filtered. The filtrate was concentrated under reduced pressure, and the residue was purified by silica gel column chromatography (AcOEt/hexane/MeOH, 1:2:0 to 1:0:0.05) to afford the product 14 (300 mg, 32% from MsCl) and product 15 (260 mg, 52% from MsCl) as colorless oils.

Synthesis of 20 and 21 (Compound 20 was prepared by a different method from the reported procedure.)

Triethylamine (0.80 mL, 5.7 mmol) was added to a solution of pentaethylene glycol (1.0 mL, 4.7 mmol) in anhydrous CH₂Cl₂ (30 mL). The mixture was cooled to 0 °C, then methanesulfonyl chloride (0.29 mL, 3.8 mmol) was added dropwise to it, and the whole was stirred for 4 h at 0 °C and for 11 h at room temperature. The reaction mixture was washed with 1 N HCl and brine, and then dried over Na₂SO₄. The solvent was removed under reduced pressure. The residue was dissolved in DMF (1.5 mL), and sodium azide (280 mg, 4.3 mmol) was added to the resulting solution. The mixture was stirred at 80 °C for 16 h, and the solvent was removed under reduced pressure. Et₂O was added to the residue, and the resulting suspension was filtered. The filtrate was concentrated under reduced pressure, and the residue was purified by silica gel column chromatography (CHCl₃/MeOH, 50:1) to afford the product 20 (250 mg, 25% from MsCl) and the product 21 (220 mg, 40% from MsCl) as colorless oils.

**Scheme S10.** Synthesis of reported fluorescent TSPO ligand 2.\textsuperscript{S4}

**Synthesis of 31 (Compound 31 was prepared by a small modification of a known procedure.\textsuperscript{S10})**

Di-tert-butyl dicarbonate (0.50 g, 2.3 mmol) in MeOH (10 mL) was added dropwise over 3 h to a solution of hexamethylene diamine (1.1 g, 9.2 mol) in MeOH (20 mL) at 0 °C, and the mixture was stirred for 4 h at the same temperature. The reaction mixture was further stirred for 10 h at room temperature, and then concentrated under reduced pressure. After addition of water,
the resulting mixture was extracted with Et₂O. The combined organic phase was dried over Na₂SO₄, and the solvent was removed under reduced pressure to afford the product 31 (500 mg, quant.) as a colorless oil.

31: ¹H NMR (400 MHz, CD₃OD) δ 1.29–1.36 (m, 4H), 1.42 (s, 9H), 1.42–1.50 (m, 4H), 2.61 (t, J = 7.2 Hz, 2H), 3.02 (t, J = 7.2 Hz, 2H); ¹³C NMR (100 MHz, CD₃OD) δ 27.7, 27.7, 28.8, 30.9, 33.8, 41.2, 42.5, 79.8, 158.6.

Synthesis of 32 (Compound 32 was prepared by a small modification of a known procedure.)

N,N-Diisopropylethylamine (0.71 mL, 4.2 mmol) and NBD-Cl (280 mg, 1.4 mmol) were added to a solution of 31 (300 mg, 1.4 mmol) in anhydrous DMF (3.0 mL) at 0 °C, and the resulting mixture was stirred for 2 d at room temperature. After removal of the solvent under reduced pressure, the residue was purified by silica gel column chromatography (CHCl₃) to afford the product 32 (370 mg, 70%) as a brown paste.

32: ¹H NMR (400 MHz, CDCl₃) δ 1.33–1.53 (m, 6H), 1.40 (s, 9H), 1.79 (tt, J = 7.2, 7.2 Hz, 2H), 3.10 (t, J = 6.6 Hz, 2H), 3.44–3.54 (m, 2H), 4.63 (br-s, 1H), 6.15 (d, J = 8.8 Hz, 1H), 6.99 (br-s, 1H), 8.44 (dd, J = 2.0, 8.8 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ 26.1, 26.3, 28.3, 28.5, 30.0, 40.2, 43.8, 79.3, 98.6, 123.3, 136.8, 144.1, 144.3, 156.3.

Synthesis of 33 (Compound 33 was prepared by a small modification of a known procedure.)

32 (260 mg, 0.69 mmol) was dissolved in THF (2.0 mL) and MeOH (0.5 mL), and 12 M HCl (0.1 mL) was added. The mixture was refluxed for 28 h, and then the solvent was removed under reduced pressure. The residue was washed with CHCl₃ to afford the product 33 (160 mg, 74%) as a red solid.

33: ¹H NMR (400 MHz, CD₃OD) δ 1.43–1.58 (m, 4H), 1.71 (tt, J = 7.3, 7.3 Hz, 2H), 1.81 (tt, J = 7.1, 7.1 Hz, 2H), 2.95 (t, J = 7.6 Hz, 2H), 3.54 (br-s, 2H), 6.31 (d, J = 9.2 Hz, 1H), 8.45 (d, J = 9.2 Hz, 1H).

Synthesis of 2 (Compound 2 was prepared by a small modification of a known procedure.)

Oxalyl chloride (24 µL, 0.29 mmol) was added to a stirred solution of 2-phenylindole (50 mg, 0.26 mmol) in anhydrous THF (1.5 mL) at 0 °C, and the mixture was stirred for 3 h at room temperature. 33 (90 mg, 0.29 mmol) and N,N-diisopropylethylamine (0.27 mL, 1.6 mmol) were then added to the mixture, and stirring was continued for 14 h. After removal of the solvent under reduced pressure, the residue was purified by silica gel column chromatography (MeOH/CHCl₃, 1:10), followed by preparative TLC (MeOH/CHCl₃, 1:10), to afford the product 2 (15 mg, 11%) as an orange solid.

2: ¹H NMR (400 MHz, CDCl₃/CD₃OD, 20:1) δ 1.22–1.32 (m, 2H), 1.32–1.41 (m, 4H), 1.66 (tt, J = 7.2 Hz, 2H), 2.96 (t, J = 6.6 Hz, 2H), 3.36 (br-s, 2H), 6.03 (d, J = 8.8 Hz, 1H), 7.14–7.19 (m, 2H), 7.28–7.35 (m, 4H), 7.42–7.46 (m, 2H), 8.02–8.07 (m, 1H), 8.33 (d, J = 8.8 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃/CD₃OD, 20:1) δ 26.1, 26.2, 28.0, 28.7, 38.8, 43.7, 98.5, 109.9, 111.7, 121.4, 122.8, 123.8, 127.1, 127.9, 128.3, 129.2, 129.4, 132.1, 136.1, 137.0, 144.1, 148.4, 165.5, 187.1; HRMS (ESI) Calcd. for C₂₅H₂₀N₄O₅Na: 549.1857, Found 549.1856.
Scheme S11. Synthesis of fluorescent TSPO ligand 3.

Synthesis of 34 (Compound 34 was prepared by a small modification of a known procedure.\textsuperscript{520})

3-Amino-1-propanol (0.18 mL, 2.3 mmol) was added dropwise to a solution of di-tert-butyl dicarbonate (0.50 g, 2.3 mmol) and sodium hydrogen carbonate (0.39 g, 4.6 mmol) in MeOH (10 mL), and the mixture was stirred for 18 h at room temperature. After removal of the solvent, the residue was taken up in water and extracted with AcOEt. The combined organic layer was washed with brine and dried over Na$_2$SO$_4$. The solvent was removed under vacuum to afford the product 34 (0.40 g, quant.) as a colorless oil. 34: 1H NMR (400 MHz, CDCl$_3$) $\delta$ 1.43 (s, 3H), 1.65 (tt, $J = 5.9$ Hz, 2H), 3.27 (t, $J = 6.4$ Hz, 2H), 3.65 (t, $J = 6.0$ Hz, 2H); 13C NMR (100 MHz, CDCl$_3$) $\delta$ 28.5, 33.0, 37.1, 59.4, 79.8, 157.3.

Synthesis of 35

Diethyl azodicarboxylate (72 $\mu$L, 0.40 mmol) was added to a solution of triphenylphosphine (110 mg, 0.40 mmol), 1 (100 mg, 0.27 mmol) and 34 (70 mg, 0.40 mmol) in anhydrous CH$_2$Cl$_2$ (1.5 mL), and the mixture was stirred for 28 h at room temperature. The solvent was removed under reduced pressure, and the residue was purified by silica gel column chromatography (AcOEt/hexane, 1:3 to 1:2), followed by preparative TLC (MeOH/CHCl$_3$, 1:100), to afford the product 35 (92 mg, 65%) as a colorless paste. 35: 1H NMR (400 MHz, CDCl$_3$) $\delta$ 0.83 (t, $J = 7.4$ Hz, 3H), 0.85 (t, $J = 7.0$ Hz, 3H), 1.05–1.23 (m, 6H), 1.40 (s, 9H), 1.50 (tt, $J = 7.7$, 7.7 Hz, 2H), 1.81 (tt, $J = 7.1$, 7.1 Hz, 2H), 2.79 (t, $J = 7.8$ Hz, 2H), 2.91–3.01 (m, 4H), 3.93 (t, $J = 7.6$ Hz, 2H), 4.22–4.34 (m, 1H), 7.33–7.37 (m, 3H), 7.37–7.43 (m, 2H), 7.46–7.53 (m, 3H), 8.42–8.47 (m, 1H); 13C NMR (100 MHz, CDCl$_3$) $\delta$ 13.9 and 14.0, 20.1 and 20.4, 28.5, 29.6 and 30.7, 30.4, 37.9, 41.7, 44.6 and 48.6, 79.6, 110.1, 112.2, 122.9, 123.4, 124.0, 126.9, 128.3, 129.6, 130.1, 130.9, 136.1, 147.9, 155.9, 167.5, 187.7; HRMS (ESI) Calcd. for C$_{32}$H$_{43}$N$_3$O$_4$Na: 556.3146, Found 556.3155.

Synthesis of 3

Trifluoroacetic acid (140 $\mu$L, 1.8 mmol) was added to a solution of 35 (24 mg, 44 $\mu$mol) in CH$_2$Cl$_2$ (1.5 mL), and the mixture
was stirred for 20 h at room temperature. Saturated NaHCO₃ was added to it, and the resulting mixture was extracted with CH₂Cl₂. The combined organic layer was washed with brine, and dried over Na₂SO₄. The solvent was removed under reduced pressure, and the crude material was dissolved in MeOH (2 mL). N,N-Diisopropylethylamine (15 µL, 89 µmol) and NBD-Cl (8.9 mg, 44 µmol) were added to the solution, and stirring was continued for 16 h at room temperature. After removal of the solvent under reduced pressure, the residue was purified by silica gel column chromatography (MeOH/CHCl₃, 1:100), followed by preparative TLC (MeOH/CHCl₃, 1:100), to afford the product 3 (19 mg, 71%) as an orange solid. 3: M.p. 88–89 °C; ¹H NMR (400 MHz, CDCl₃) δ 0.83 (t, J = 7.0 Hz, 3H), 0.84 (t, J = 6.8 Hz, 3H), 1.01–1.12 (m, 2H), 1.14 (tt, J = 6.8, 6.8 Hz, 2H), 1.18 (tt, J = 7.2, 7.2 Hz, 2H), 1.48 (tt, J = 7.6, 7.6 Hz, 2H), 2.00 (tt, J = 6.6, 6.6 Hz, 2H), 2.79 (tt, J = 7.8 Hz, 2H), 2.95 (t, J = 7.8 Hz, 2H), 3.27–3.36 (m, 2H), 4.02 (t, J = 7.2 Hz, 2H), 5.87 (d, J = 8.4 Hz, 1H), 6.76 (br-s, 1H), 7.25–7.33 (m, 8H), 8.29–8.34 (m, 2H); ¹³C NMR (100 MHz, CDCl₃) δ 13.8 and 14.0, 20.1 and 20.4, 28.1, 29.5 and 30.7, 40.9, 41.3, 44.7 and 48.6, 98.9, 110.0, 112.2, 122.6, 123.7, 124.3, 126.6, 128.3, 129.1, 130.1, 130.6, 135.8, 136.4, 143.9, 144.1, 147.7, 167.7, 187.6; HRMS (ESI) Calcd. for C₃₃H₃₆N₆O₅Na: 619.2639, Found 619.2646.
**General information for LC-LIF-MS system**

**Materials for HPLC analysis**
Trifluoroacetic acid (TFA), distilled water containing 0.1vol% formic acid (FA), and acetonitrile (MeCN) containing 0.1vol% FA were purchased from Kanto Chemical Co., Inc.

**Liquid chromatography and mass spectrometry**
Mass spectra were acquired using a LTQ Orbitrap XL equipped with an electrospray ionization (ESI) source (Thermo Fisher Scientific, Inc.). For automatic measurement, the system was controlled by Xcalibur software (Thermo Fisher Scientific, Inc.). Full mass scan was acquired in the FT mode (resolution 60,000) and MS/MS scan (CID) was acquired in the ion trap (IT) mode or FT mode. In the nano flow HPLC system (UltiMate 3000 nano LC system, Thermo Fisher Scientific, Inc.), an Acclaim PepMap 100 C18 (0.075 i. d. x 150 mm, Thermo Fisher Scientific, Inc.) and a ZORBAX 300SB-C18 (0.3 i. d. x 5 mm, Agilent Technologies, Inc.) were used as analytical and trap columns, respectively. For the analytical column, mobile-phase A (distilled water containing 0.1vol% FA and 4vol% MeCN) and mobile-phase B (MeCN containing 0.1vol% FA) were utilized. Mobile-phase C (distilled water containing 0.1vol% TFA) and mobile-phase D (MeCN containing 0.1vol% TFA) were used for the trap column. Gradient elution was done with mobile-phase A and mobile-phase B at a flow rate of 250 nL/min. Database search was performed using a peptide sequencing program, Proteome Discoverer (Thermo Fisher Scientific, Inc.) through a database MS/MS ion search, and with MASCOT (www.matrixscience.com). Theoretical mass value of peptides was calculated by Xcalibur software.

**Laser-induced fluorescence detector**
The laser-induced fluorescence (LIF) detector (LIF 727, GL Sciences, Inc.) was fitted with a 6 nL flow cell and connected to the nano flow HPLC system (UltiMate 3000 nano LC system, Thermo Fisher Scientific, Inc.). Parameters of the LIF 727 were as follows; PMT 700V, response 0.5 sec, output range 1 RFU/FS1V, band pass filter 500–600 nm.

**TSPO knock-down**
HEK293T cells were plated in 6 well plates at the density of 2.5×10⁵ cells per well. Cells were transfected with 40 nM Stealth RNAi (TSPO-HSS141398, TSPO-HSS186329; Invitrogen Life Technologies) using X-tremeGENE siRNA Transfection Reagent (Roche) and Opti-MEM I reduced serum medium (Gibco Life Technologies). Negative Universal control Med (Invitrogen Life Technologies) was used as a negative control. After 24 h incubation, medium was changed to fresh growth medium. After further incubation for 24 h, cells were pretreated with or without 1 (87.5 μM) for 0.5 h and then treated with 3-ONBD (0.5 μM) for 1.5 h. After the treatment of compounds, cells were washed with PBS and lysed with lysis buffer (20 mM Hepes–Na (pH 7.0), 1 mM EDTA, 0.5% Triton X-100, and complete mini (Roche, 1 tablet/10 mL)).

**Animal experiment**
Kidney mitochondria were prepared from female B6 mice (Nihon SLC, Hamamatsu, Japan). All procedures were conducted according to the RIKEN guidelines for animal research and were approved by the RIKEN Animal Experiments Committee.

**Western blotting**
To detect VDAC1, TSPO and tubulin, anti-VDAC1/Porin (1:1000, abcam, ab14734), anti-PBR (1:10000, abcam, ab109497) and anti-α-tubulin (1:1000, sigma, T9026) antibodies were used, respectively. Goat anti-mouse IgG (1:2000, Bio-Rad, #170-6516) and goat anti-rabbit IgG (1:2000, Santa Cruz Biotechnology, SC-2004) were used as secondary antibodies. Immunoreactive bands were detected using a chemiluminescence reagent (Immobilon Western chemiluminescent HRP substrate,
Millipore) with a luminescent image analyzer (LAS-4000, Fujifilm).
