1. General

All reactions were carried out under an atmosphere of nitrogen with magnetic stirring. $^1$H and $^{13}$C NMR spectra were recorded on a Varian 400-MR spectrometer at ambient temperature. $^1$H NMR data are reported as follows: chemical shift in ppm downfield from tetramethylsilane ($\delta$ scale), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet and br = broad), coupling constant (Hz), and integration. $^{13}$C NMR chemical shifts are reported in ppm downfield from tetramethylsilane ($\delta$ scale). All $^{13}$C NMR spectra were obtained with complete proton decoupling. IR spectra were obtained using a Shimadzu FTIR-8400 Fourier transform infrared (FT-IR) spectrometer equipped with PIKE MIRacle attenuated total reflection (MIR-ATR) attachment. The GPC analysis was carried out with TSKgel GMHXL (CHCl$_3$, polystyrene standards). Preparative GPC was performed on JAI LC-908 equipped with JAIGEL-1H and -2H columns in a series (CHCl$_3$). UV spectra were recorded on a JASCO V-500 spectrometer equipped with a JASCO ETC-505T temperature/stirring controller at 20 °C. CD spectra were recorded on a JASCO J-750 spectrometer equipped with a JASCO PTC-423L temperature/stirring controller at 20 °C. The chiral HPLC analysis was carried out on TOSOH 8020 series equipped with CHIRALCEL® OZ-H (hexane and 2-propanol). Flash chromatography was performed using a Biotage Isolera One flash purification system with silica gel flash cartridges.

Tetrahydrofuran (THF) and toluene were dried and deoxygenized using an alumina/catalyst column system (Glass Contour Co.). 1,2-Bis(bromomethyl)-3,6-dimethyl-4,5-dinitrobenzene, 1 acetic formic anhydride (AFA), 2 $o$-TolNiCl(PMe$_3$)$_3$, 3 (2',3'-diisocyanato-4'-methyl-[1,1'-biphenyl]-2-yl)diphenylphosphine sulfide S1, 4 and dimethyl (1-bromonaphthalen-2-yl)phosphonate 12 were prepared according to the reported procedure. Other chemical reagents were purchased from the commercial sources. Primary alcohols (1-Propanol, 1-butanol, 1-pentanol, 1-hexanol, 1-heptanol, 1-octanol, 1-nonanol, and 1-decanol), BF$_3$·Et$_2$O, 1,2-dimethoxyethane (1,2-DME), and tert-butyl methyl ether (MTBE) were distilled over CaH$_2$ and degassed prior to use. Triethylamine (Et$_3$N) was distilled over KOH and degassed. Phosphoryl chloride (POCl$_3$) was distilled and degassed. K$_2$PO$_4$ was dried under reduced pressure at 150 °C for 5 h before use. Other chemicals were used without further purification.

The organic phase was washed with water (10 mL) and brine (10 mL) and dried over Na₂SO₄ followed by preparative GPC gave 5(300) as a beige solid (29.7 mg, 87%). ¹H NMR (CDCl₃) δ 5.03 (2H, br s), 4.68 (2H, br s), 4.10–4.03 (6H, m), 2.39 (6H, br s), 1.58 (4H, br s), 1.36–1.23 (14H, m), 0.81 (6H, br s); GPC (CHCl₃, g/mol): $M_n = 8.7 \times 10^4$, $M_w/M_n = 1.17$.

Synthesis of 5(1000/50):

[ Polymerization ] A THF solution of o-TolNiCl(PMe₃)₂ (8.73 mM, 134 μL, 1.17 μmol) was added to THF (29 mL). To the solution was added a mixture of monomer M5-NC (587 mg, 1.17 mmol) and S1 (58.7 μmol) in THF (20 mL) at room temperature. The mixture was stirred for 24 h at room temperature. To the reaction mixture was added NaBH₄ (17.8 mg), and the mixture was stirred for 1 h. The solvent was then evaporated until approximately half of the original volume. The mixture was poured into vigorously stirred MeOH (600 mL), and precipitated polymer was collected by centrifugation followed by washing with MeOH × 2. After drying in vacuo, fibriform polymer was obtained.

[ Reduction of Phosphine Sulfide ] A mixture of the obtained polymer (56.1 μmol P) and P(NMe₂)₃ (0.408 mL, 2.24 mmol) in toluene (5.3 mL) was stirred at 110 °C for 24 h. The mixture was diluted with THF (1 mL) and poured into vigorously stirred MeOH (600 mL). Precipitated material was collected by filtration and washed with MeOH × 2 to give 5(1000/50) as fibriform solid (531 mg, 91%). ¹H NMR (CDCl₃) δ 4.96–4.10 (10H, m), 2.38 (6H, br s), 1.59–1.23 (18H, m), 0.81 (6H, br s); ³¹P NMR (CDCl₃) δ −15.2; Molecular weight could not be determined by GPC, because of the exclusion limit of the column.

To the solution was added Pd\(_2\)dba\(_3\) (5.0 mM in 1,2-DME, 500 \( \mu \)L, 2.5 \( \mu \)mol). The mixture was stirred at room temperature for 10 min. To the mixture were added K\(_3\)PO\(_4\) (63.7 mg, 0.3 mmol), 1-naphthylboronic acid 11 (30.0 mg, 0.2 mmol), aryl bromide 12 (31.5 mg, 0.1 mmol), and H\(_2\)O (160 \( \mu \)L). The mixture was stirred at 40 °C for 24 h. To the mixture was added 1,2-bis(diphenylphosphino)ethane (5 mg) to dissolve the gelled polymer. Subsequent addition of acetonitrile (10 mL) resulted in precipitation of polymer 5(1000/50). The suspension was passed through a pad of Celite using MeCN as an eluent. The filtrate was dried over Na\(_2\)SO\(_4\) and subjected to PTLC (hexane/AcOEt = 1/4). Further purification was made by GPC. The corresponding product (+)-(R)-form was isolated in 45% yield. The enantiomeric excess of the product was determined to be 91% by HPLC with CHIRALCEL® OZ-H (Eluent: Hexane/2-PrOH =
