Figure S1. Stability of the superhydrophobic coatings. (a) Water contact angles (static, advancing and receding) of a poly(2-octyl cyanoacrylate) superhydrophobic film over 4 weeks (indoor) and after 5 month. (b) WCA of a poly(2-octyl cyanoacrylate) superhydrophobic film over 8 weeks (outdoor).

Description of the conditions for the long term indoor and outdoor stability tests.

Indoor stability test was performed by keeping a superhydrophobic sample in a Petri-dish in the lab environment at room temperature for several months.

Outdoor stability test was performed by exposing a sample to the urban environment such as sunlight, dust or occasional rain.

All samples were analyzed once a week by measuring the WCAs.
