Preparation of GO

Graphene oxide was prepared from natural graphite by a modified Hummer’s method.¹-³ Briefly, concentrated H₂SO₄ was added to a 250-mL flask filled with graphite. Next NaNO₃ was added and then solid KMnO₄ was gradually added with stirring while the temperature of the mixture was kept below 20 °C. Next the temperature was increased to 30 °C and excess distilled water was added to the mixture and then the temperature was increased to 80 °C. Finally, 30% H₂O₂ was added until the color of mixture changed to brilliant yellow. The mixture was filtered and washed several times with 5% aqueous HCl to remove metal ions and then washed with distilled water to remove the acid. The resulting filter cake was dried in air and then re-dispersed into water. Suspended GO sheets were obtained after ultrasonic treatment.
