Electronic Supplementary Information

Mesoporous anatase TiO$_2$ submicrospheres embedded in self-assembled three-dimensional reduced graphene oxide networks for enhanced lithium storage

Hunan Key Laboratory of Micro-Nano Energy Materials and Devices, Faculty of Materials and Optoelectronic Physics, Xiangtan University, Hunan 411105, China

Figure S1 Typical AFM image of GO coated on silicon wafer. The AFM result shows that the thickness of GO is about 1.5nm.

Figure S2 Photographs and PH illustrations of pure TiO$_2$, GO and TiO$_2$@GO in water solution.
Figure S3 The TGA curve of MTO/3D-GN composite prepared using GO and amorphous TiO$_2$ submicrospherer with weight ratio of 1: 1. One can see that the mass loss is only 11% over the range of 100~700°C, indicating that the reduction of GO is efficient and the obtained MTO/3D-GN hybrid aerogel is thermally stable.
