c Figure S1. Cyclic voltammograms of (a) a physical mixture of Ni(OH)₂ particles with graphene oxide, (b chemically reduced graphene oxide (cRGO), and (c) microwave treated graphene oxide on glassy carbon electrodes in O₂-saturated 0.5 M NaOH (scan rate 100 mV s⁻¹, scan direction from -0.1 V to -0.7 V vs. Ag/AgCl).
**Figure S2.** Sequential oxygen reduction cyclic voltammetry curves for the Ni(OH)$_2$/graphene oxide hybrid catalyst in oxygen saturated 0.5M NaOH solution at potential scan rate of 50 mV s$^{-1}$.
