METHODS

Synthesis of FeS$_2$ nanoparticle films

FeS$_2$ nanoparticle films were directly prepared on FTO substrate by sol-gel method without pre-coating ZnO seed layer. Fe(NO$_3$)$_3$·9H$_2$O was dissolved in a mixture of 2-methoxyethanol and acetyl acetone with a molar ratio 10:1. The solution was stirred at room temperature for 12 h. Then the ZnO seed layer was baked at 500 °C for 1 h. The FeS$_2$ films were obtained by annealing at 400 °C for 2 h.

temperature for 2 h to form homogeneous nitrate sol with a concentration of 0.6 M. The substrates were dipped into the sol solution and pulled up using a dip coater at a rate of 200 mm min\(^{-1}\), and then the coated substrates were dried at 100 °C in air for 20 min. This dipping and drying process was repeated for six cycles to obtain uniform-covered films. The finished gel films were annealed at 500 °C for 30 min to form the precursor films. The obtained precursor films and a certain amount of sublimed sulfur powder were sealed in glass ampoules. These sealed samples were annealed at 400 °C for 10 h.
