**Figure S1.** Scanning electron microscopy images of fractal silver on FTO obtained by electrodeposition at -0.85 V vs NHE for 300 s from an aqueous solution of 0.005 M Ag$_2$SO$_4$, 0.01 M H$_2$SO$_4$, and 0.5 M Na$_2$SO$_4$. 
Figure S2. Representative profilometer traces for non-coated and polymer coated silver fractal films. Polymer thickness (600 nm) was calculated by subtracting the baseline of the fractal silver (200 nm) from the baseline of the polymer-coated film (800 nm). Mean fractal heights are also shown.
