Supporting information

Figure ESI1. AFM images of a slot-die coated film, A) topography, B) phase, and C) amplitude.

The phase separation is according to the phase image in the range of 20-35 nm (based on 25 measurements) we have not obtained a desirable morphology it is therefore evident that the addition of a high boiling additive like 1-chloronaphanline or 1,8-diiodooctane should not lead to an improvement.

Figure ESI2. A photographic presentation of a device from each of the 10 different solar cells types.
