Organic LEDs (OLEDs) emit light through the generation of singlet excitons...

Dark states of organic LED molecules in reflective cavity can be converted to bright states, significantly increasing the yield of light emitted.

Can the dynamics of dark triplet excitons be manipulated for light emission?

Charge carriers trapped between two silver mirrors with light

Dark exciton states converted to bright polariton states

Dark states of organic LED molecules in reflective cavity can be converted to bright states, significantly increasing the yield of light emitted.
