Emerging contaminants in groundwater: a health risk?

Marianne Stuart

Emily Crane, Dan Lapworth, Katya Manamsa, John Talbot, Rob Ward,
Peter Williams

Tim Besien, Wayne Civil, Laura Edwards, Alwyn Hart

Lorraine Gaston

Groundwater Quality: - Public & private water supplies
Burlington House, March 2019

Already known examples

“Toxic” or environmental effects observed

- Halogenated solvents
- Plasticisers
 - Phthalates
- Polyaromatic hydrocarbons
- Breakdown products of surfactants
 - Alkyl ethoxylates and linear alkyl benzene sulphonate
- Pesticides
 - Started with DDT
- Musk-xylene

Emerging organic contaminants

- Anthropogenic organic compounds and their transformation products
- Emerge as result of:
 - Changes in use/new manufactured chemicals
 - Advances in analytical techniques
 - Better monitoring
- ECs in groundwater less well characterised than surface water, mainly due to lower concentrations

Metalddehyde

AMPA

Triclosan

Sucralose

BAM

PFOS

Microorganic contaminants

- Pesticides – newly detected or metabolites
- Pharmaceuticals – human, veterinary, illicit
- “Life style” – caffeine, artificial sweeteners
- Personal care – DEET, parabens, triclosan, musks, UV filters
- Industrial additives and by-products – dioxanes, bisphenols, MTBE, plasticisers
- Food additives – BHT
- Flame/fire retardants – PBDE, alkyl phosphates, triazoles
- Surfactants – alkyl ethoxylates, PFOS & PFOA
- Hormones and sterols – estradiol, cholesterol

Transformation products

- May be more toxic, polar or persistent than the parent
- For pesticides:
 - Desethyl, desisopropyl -from atrazine
 - BAM from diclofenil
 - AMPA from glyphosate
- Common TPs > parent concentrations have been:
 - Cotinine from nicotine
 - Clofibric acid from clofibrate
 - Nonyl phenol from NPE
- Cannot be reliably predicted from surface environments data due to different geochemical conditions and long residence times

Water quality regulation and monitoring

- Drinking Water Directive
 - Limits: pesticides & metabolites, PAH, petroleum, chlorinated solvents, THM
- WFD, GWDD and PPD
 - 21 priority and 24 hazardous substances: PCP, PBDE, octyl & nonyl phenols, PAH, pesticides
 - Also “drins”, DDT and chlorinated solvents
 - Candidates: including glyphosate, AMPA, bisphenol A, musk-xylene and PFOS
 - EQS for surface water and Threshold Values for groundwater
- Watch list
 - Surface water -10 substances including 17 α -ethinylestradiol, 17 β -estradiol, neonicotinoids, amoxicillin
 - Groundwater - being developed by CIS WGGW

Sample collection

- Relatively large volumes in glass bottles or filtered by SPE locally
- Sampling equipment
 - inert materials - pump tubing
- Sample collection staff
 - glove material
 - toiletries – insect repellent, sunscreen

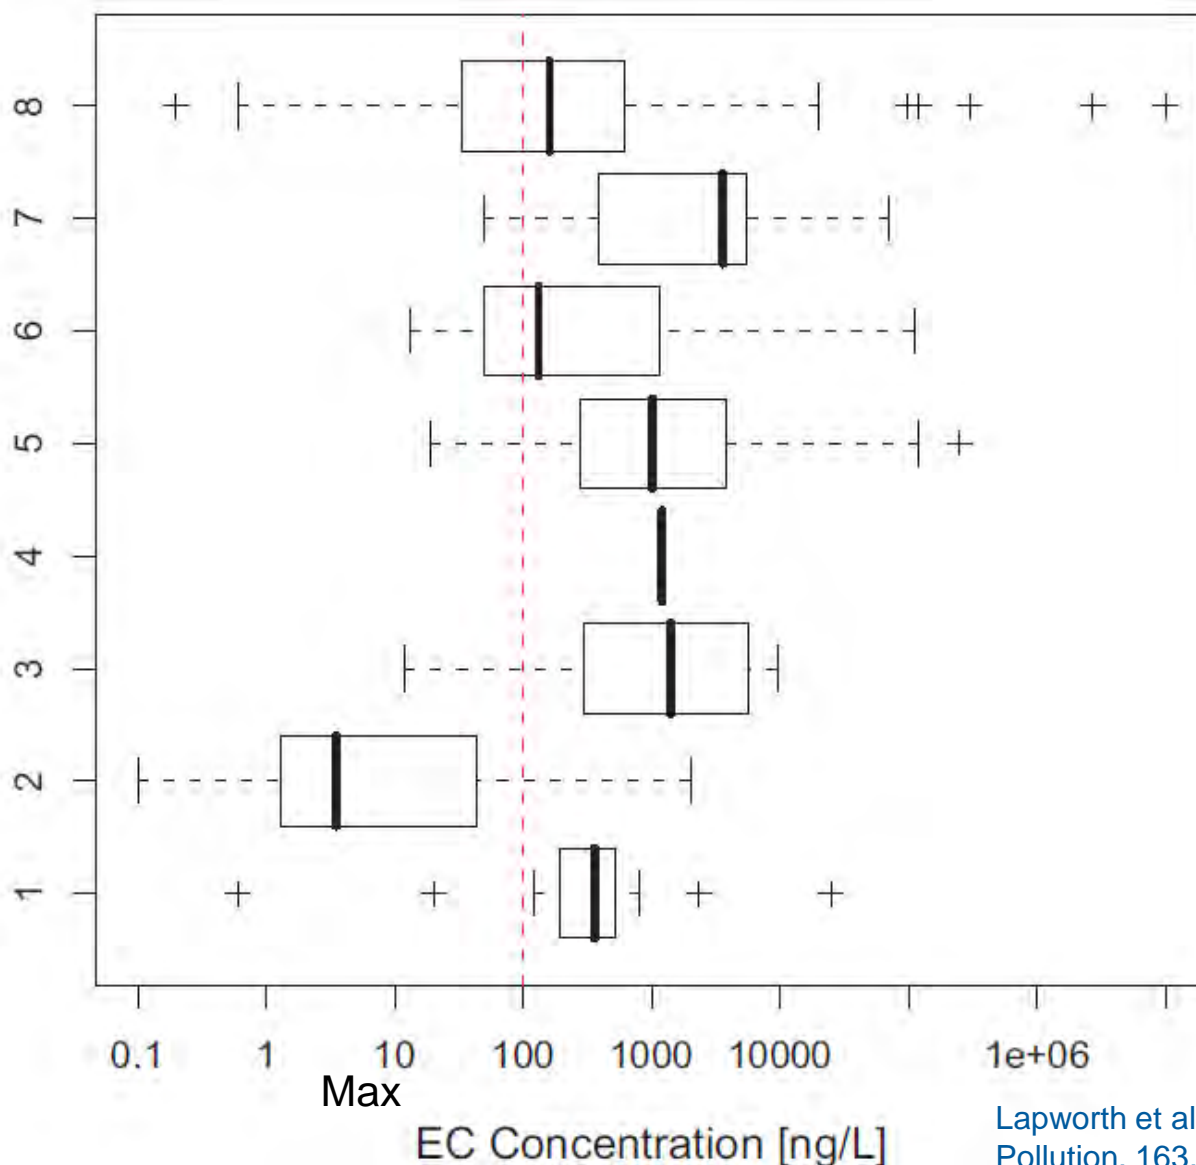

Occurrence in groundwater from literature, 2012

- Looked at pharmaceuticals, PCP, lifestyle products and some industrial compounds (non-regulated compounds)
- Groundwater EC occurrence from 14 countries reviewed
 - >70 published studies (reconnaissance and targeted)
 - >180 individual EC compounds
 - 23 compounds reported in ≥ 4 separate studies
 - -2 known endocrine disruptors, 6 other potential

Maximum detected concentration (ng/L) for compounds found in ≥ 10 studies:

Compounds	Group	Freq.	Lowest	Average	Highest
Carbamazepine	Anti-epileptic	21	1.64	5312	99194
Sulfamethoxazole	Antibiotic	14	5.7	252	1110
Ibuprofen	Anti-inflammatory	13	0.6	1491	12000
Caffeine	Lifestyle	12	13	9774	110000
Diclofenac	Anti-inflammatory	10	2.5	121	590

Box plots of occurrence of groups of ECs

8: Pharmaceuticals: antibiotics, epilepsy drugs, anti-inflammatory

7: Skin care products, insecticides

6: Caffeine, nicotine and metabolites

5: Plasticisers, detergents, flame retardants

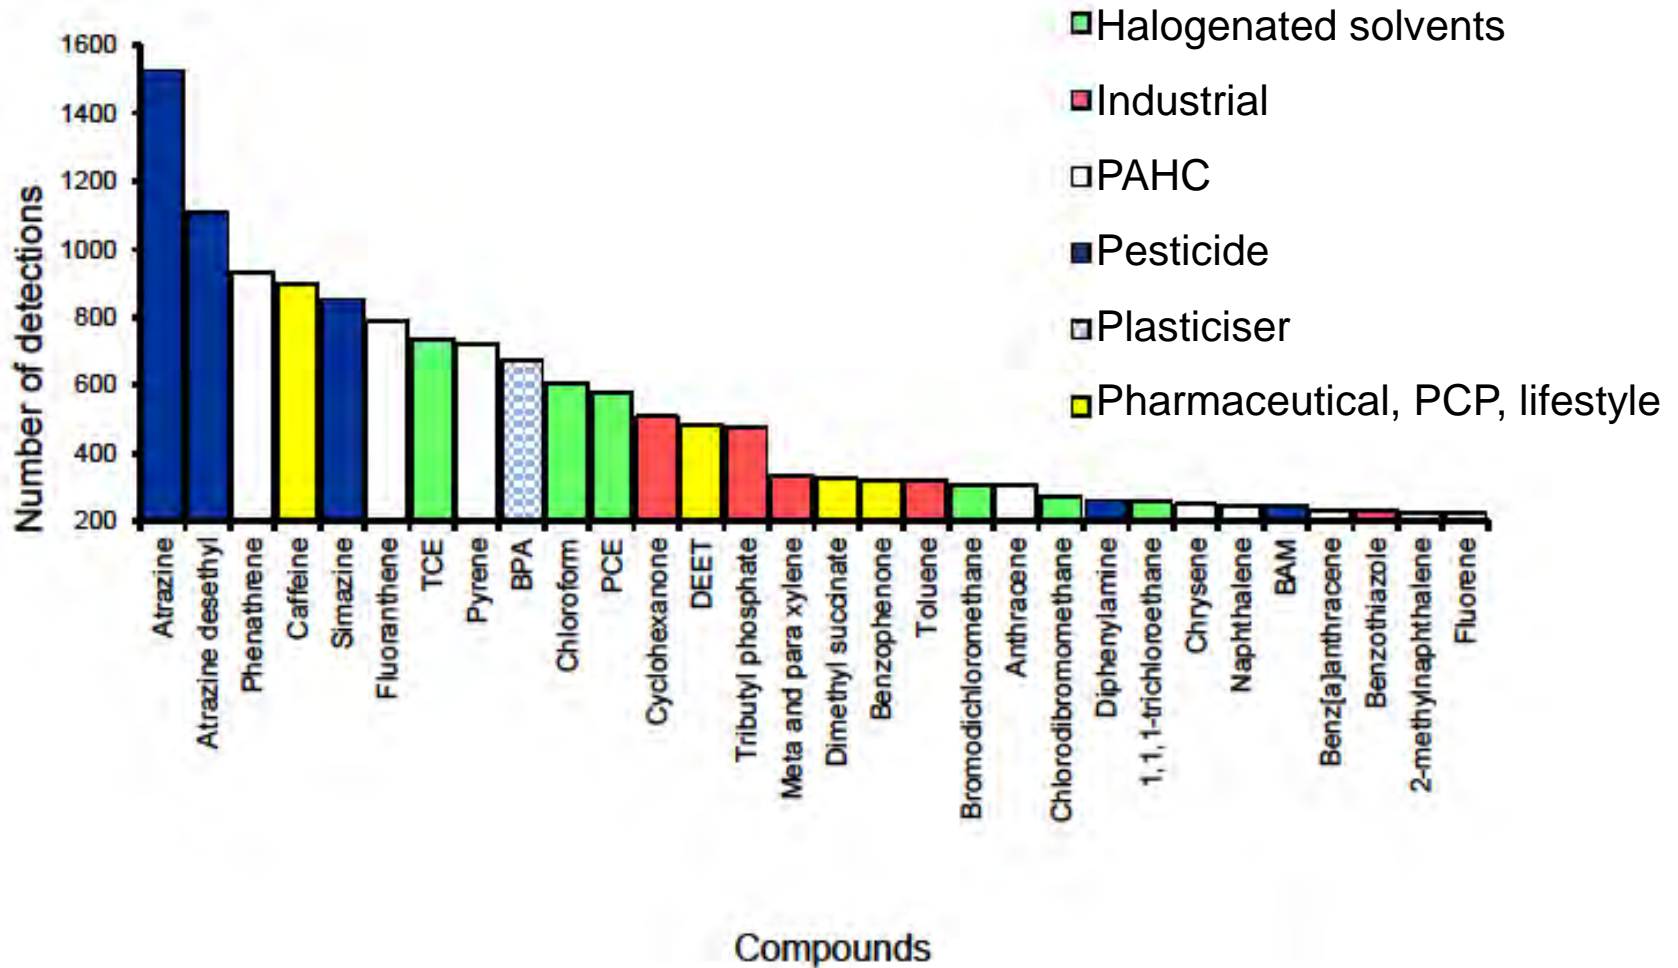

4: Illicit drugs: cocaine (n=1)

3: Food additives and artificial sweeteners

2: Steroids, hormones and metabolites

1: Veterinary antibiotics and hormones

Detections in groundwater, England and Wales, 2016 study, all EA methods

Land use

- CORINE dataset for Europe (EEA, 2006) with 60% of dominant type within 500-m radius
- Four categories:
 - Natural & Forest
 - Urban & Industrial
 - Arable
 - Pasture/grazing
- Top 30 in each land use
- Maximum concentrations

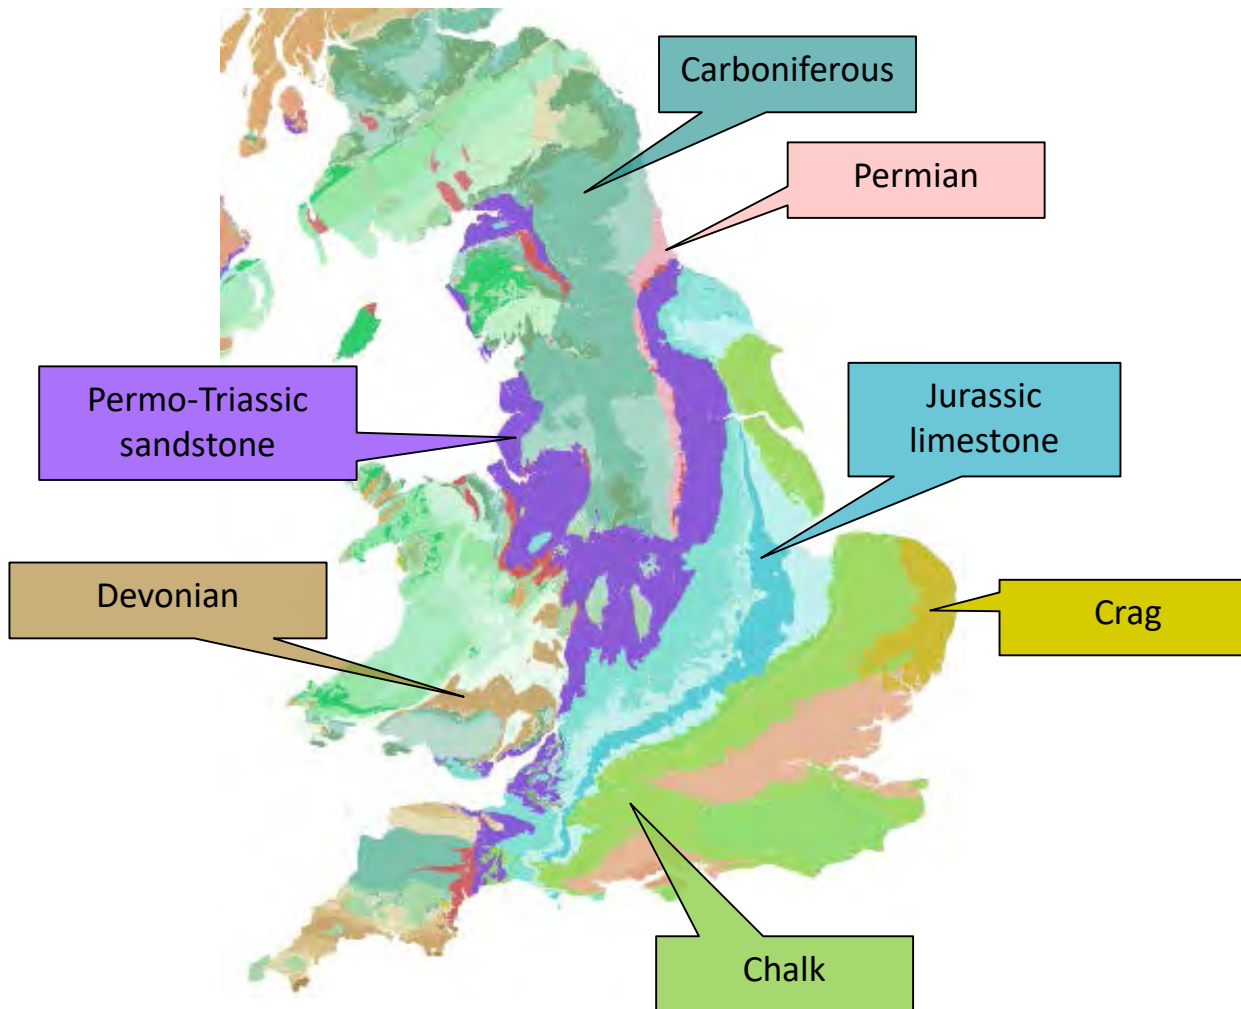

Frequency of detection in groundwater, England by GCMS, 2019

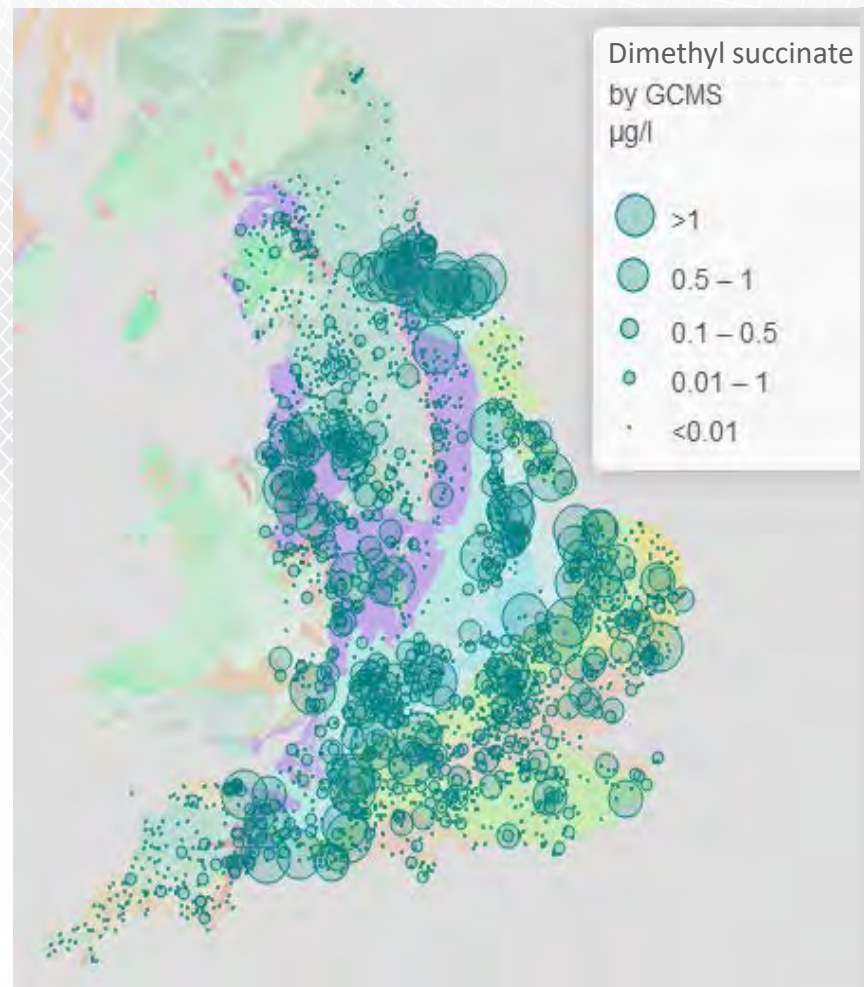

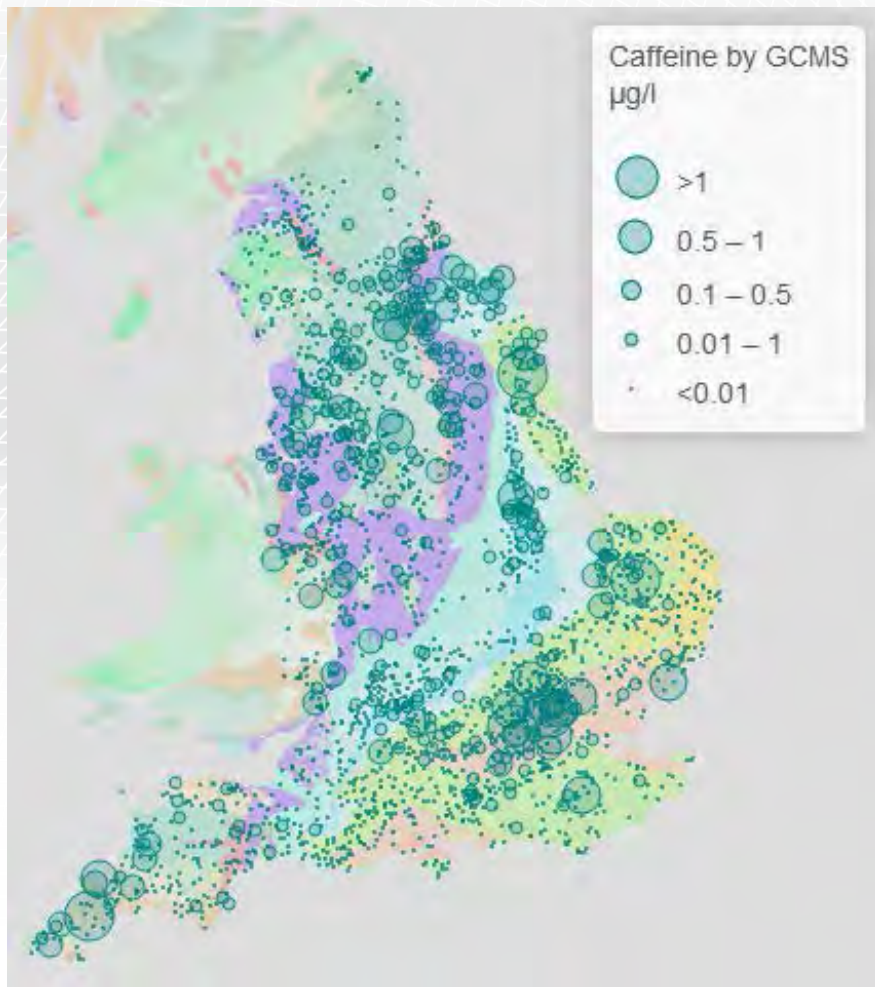

Maximum concentrations in groundwater, England by GCMS, 2019

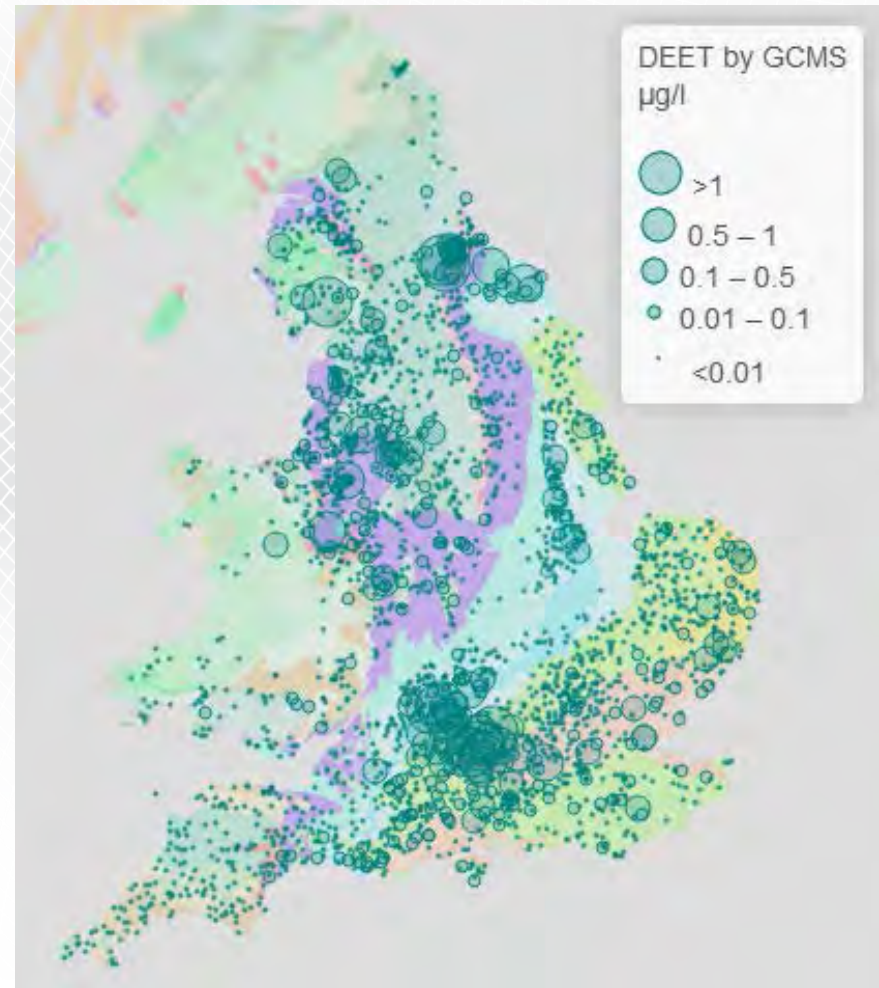

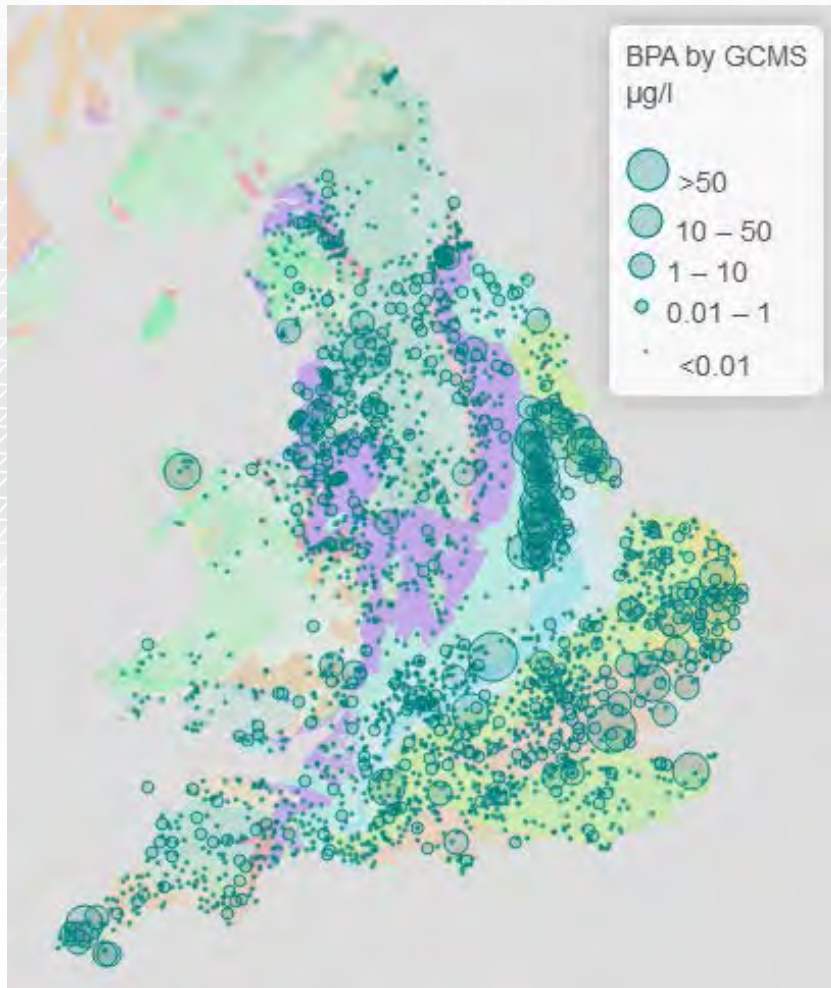

Simplified geology

Spatial plots of caffeine and dimethyl succinate

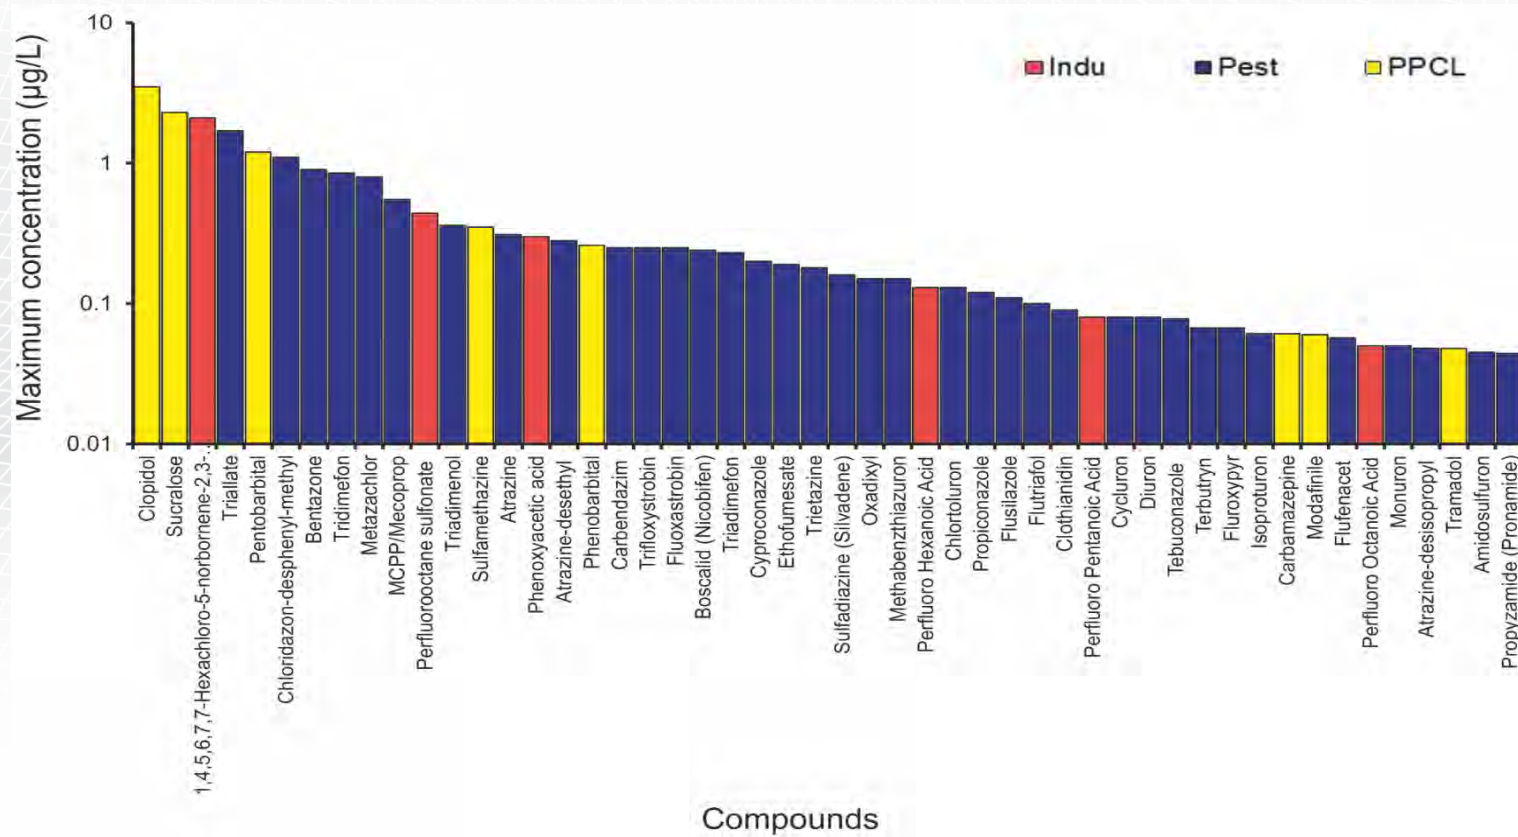

Spatial plots of bisphenol A and DEET

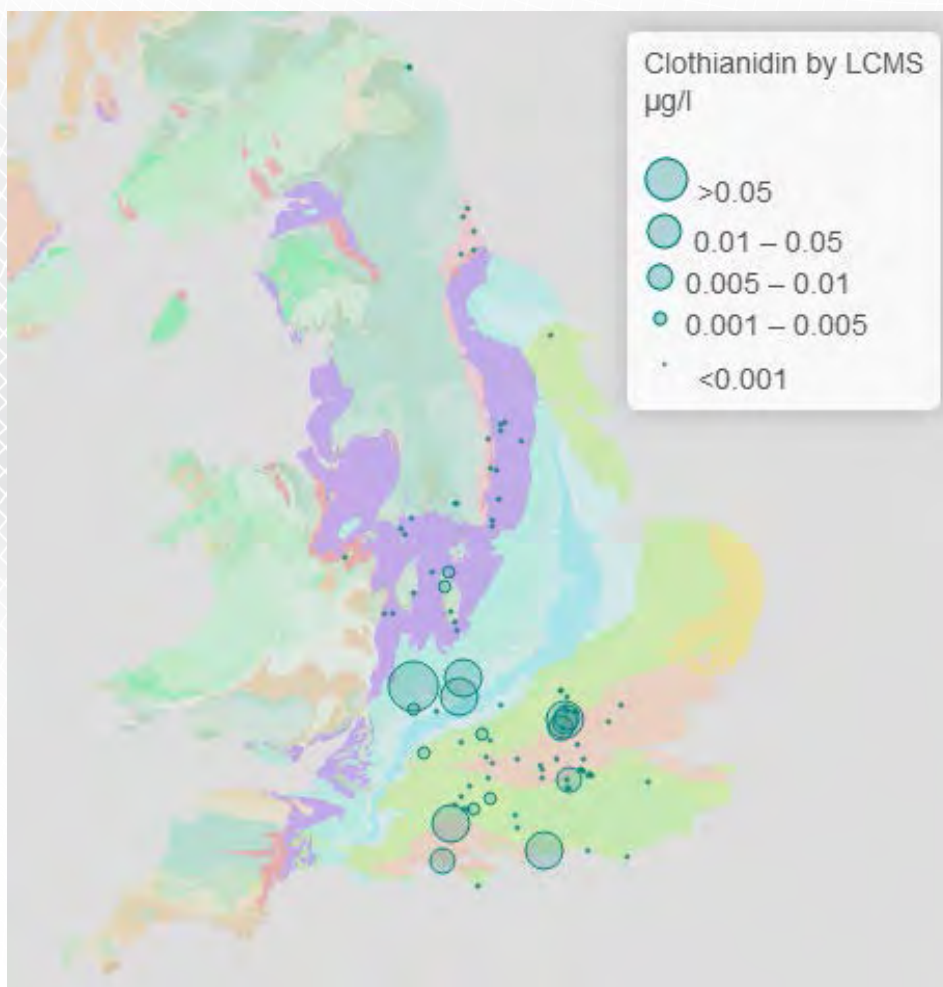

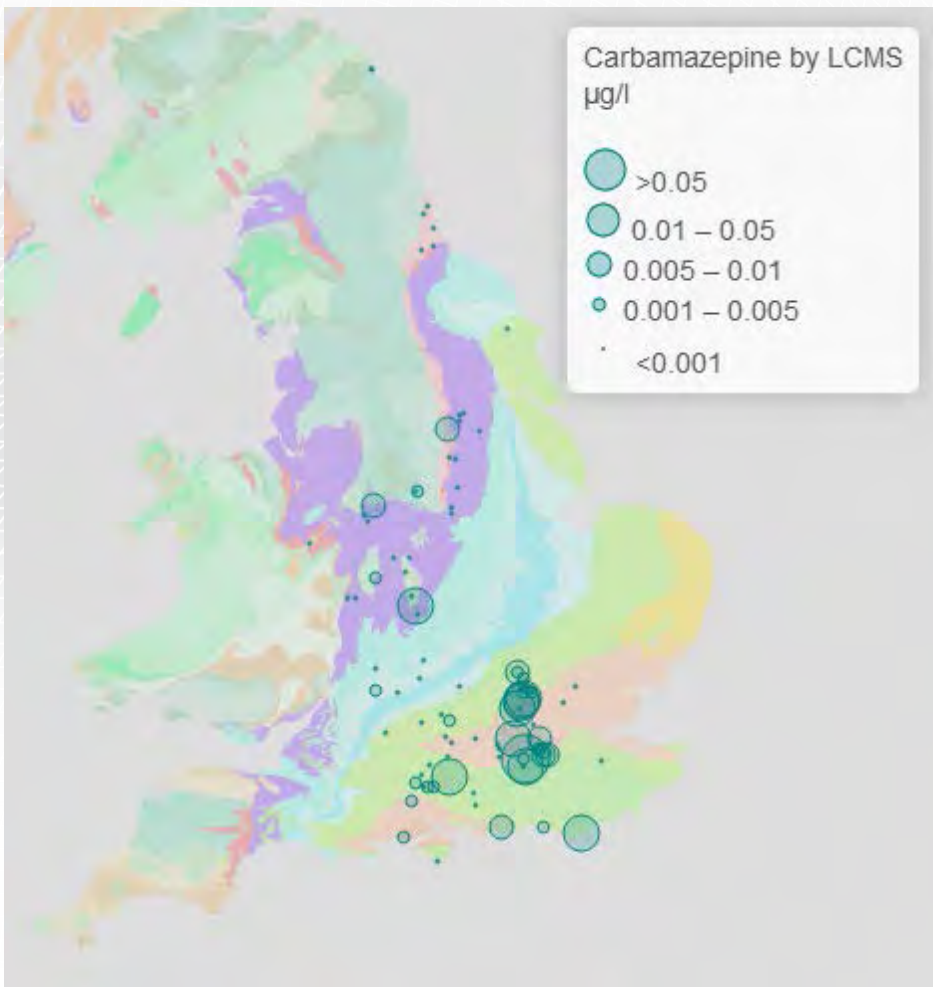

Frequency of detection in groundwater, England by LCMS, 2019

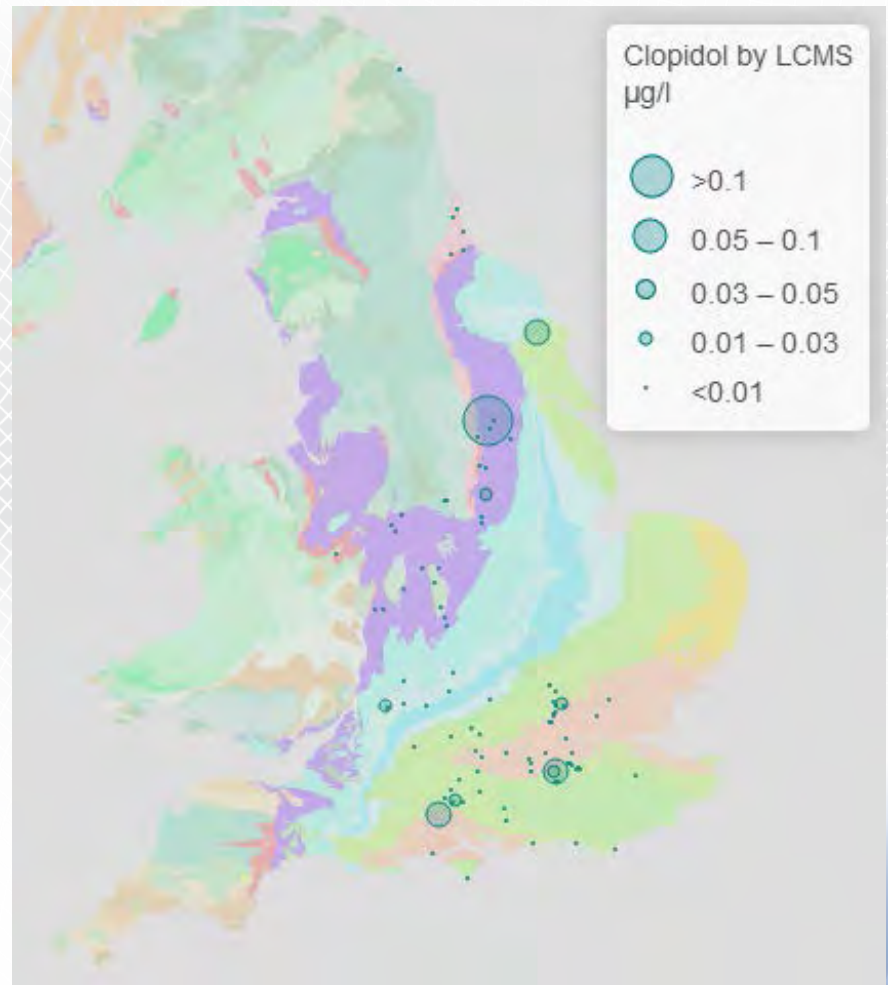

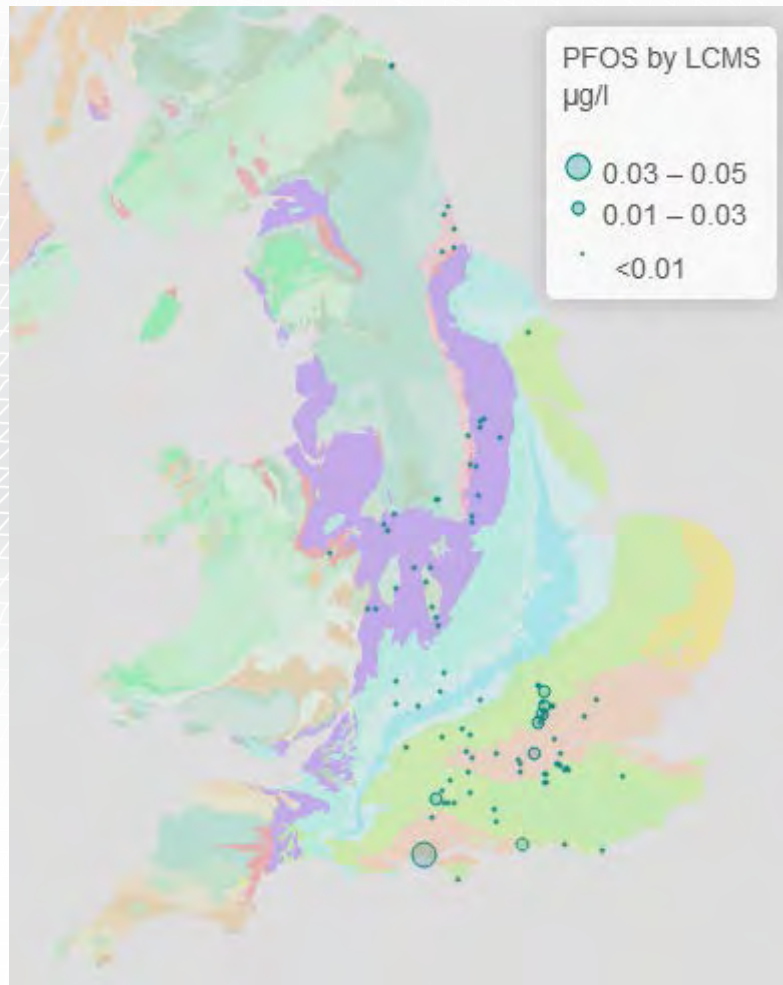

Maximum concentrations in groundwater, England by LCMS, 2019

Spatial plots of carbamazepine and clothianidin

Spatial plots of PFOS and clopidol

Health effects

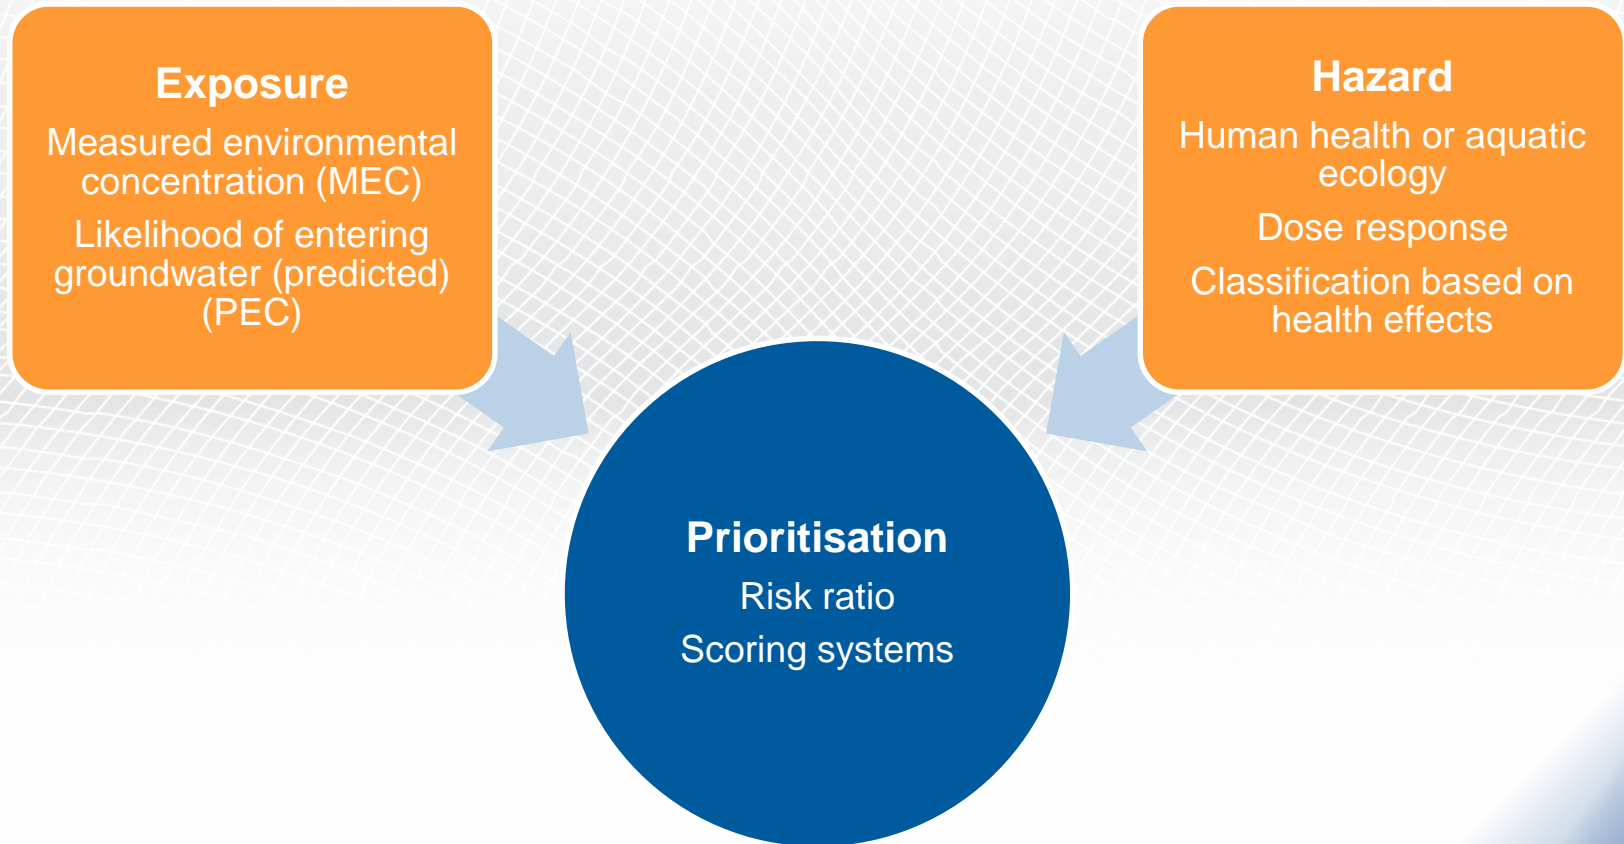

- Carcinogenic, teratogenic, mutagenic, endocrine disruption and neurotoxic effects
- Lack of data for many categories for ECs
- Complex mixtures of very low concentrations
- We are not the only receptors

Risk assessment

- Source:
 - Usage / prioritisation using prescription/ sales data
 - Formation in environment /metabolic pathway
- Pathway/mobility/attenuation:
 - Route
 - Leachability
 - Aquatic persistence (particularly for non-pesticides)
 - Water treatment recalcitrance, both waste and potable
- Exposure:
 - Measured/predicted concentrations
- Impact on receptor:
 - Human and ecological effects at environmental levels
 - Synergistic effects
 - Use surface water as early warning for groundwater

Prioritisation approaches

Are emerging contaminants in groundwater a health risk?

- An increasing range of compounds is being detected with widespread detection of trace pharmaceuticals and pesticides
- Some are probably no threat to drinking water at such $\mu\text{g/L}$ concentrations, e.g. caffeine, but there are other receptors
- Other compounds may prove to be problematic in the future
- Urban, arable and pasture areas show impact of sewage, manure/sewage sludge or industrial wastewater
- There is increasing information becoming available to allow DW limits, EQSs and TVs to be set
- Still far to go
