General consideration: All the reactions were carried out at room temperature that is 28-32°C. Unless otherwise specified, all the reagents were purchased from Sigma-Aldrich Chemical Co, Lancaster and were used directly without further any purification. NMR spectra were obtained using the Brucker DRX 300MHz spectrometer. Chemical shifts (δ) are given in ppm relative to TMS, coupling constants (J) in Hz. IR spectra were taken on VARIAN FT-IR spectrometer as KBr pellets (when solid). Elemental analysis was performed using a Perkin Elmer Autosystem XL Analyzer. Melting points were measured using a COMPLAB melting- point apparatus. Reactions were monitored by thin-layer chromatography (TLC) carried out on 0.25 mm silica gel plates visualized with UV light.

General procedure for synthesis of compounds 3(a-x) : Isatin (1.0 mmol.) and isatoic anhydride (1.0 mmol.) were combined with 10ml distilled water in a 50ml round bottom flask equipped with a stir bar. β -cyclodextrin (20 mol%) was added. Reaction was allowed to stir at room temperature for the appropriate amount of time. After completion of reaction reaction mixture was extracted with ethyl acetate. Organic layer was dried over Na_2SO_4 and concentrated in vacuo to give crude product which was further purified by column chromatography.

Catalyst recovery procedure: After completion of reaction, reaction mixture was extracted with ethyl acetate. Aqueous layer was left overnight at temperature of 5°C. Due to its low solubility β -CD precipitated at lower temperature. Cyclodextrin precipitated filtered off, dried and reused for next batch as such.
