3.1.2s Interaction between GA3 and functional monomer

The process how the equation is derived is as follows. Assuming T and M represent template molecular GA3 and functional monomer, respectively, then they are combined into pre-polymer TM_n . The reaction is as follows³⁹.

The association constant $K = \frac{[TM_n]}{[T][M]^n}$, that means $K = \frac{[TM_n]}{b_0^n \times \{a_0 - [TM_n]\}}$,

$$\text{so, } [TM_n] = \frac{Kb_0^n a_0}{1 + Kb_0^n}$$

where a_0 and b_0 refer to the concentration of GA3 and functional monomer in the pre-polymerization solution respectively; n refers to the coordination molar ratio of complex compound formed.

According to Lambert-Beer's Law $\Delta A = \Delta \epsilon l [TM_n] = \frac{\Delta \epsilon K b_0^n a_0}{1 + K b_0^n}$,

Where ΔA and $\Delta \epsilon$ refer to the difference of the UV absorbance and molar absorptivity of the solution before and after the addition of functional monomer; l refers to the length of light path.

The equation used for the study of the interaction between GA3 and different functional monomers can be finally derived as follows.

$$\frac{\Delta A}{b_0^n} = -K\Delta A + K\Delta \epsilon l a_0$$
