19. Calculation of the detection limit(LOD):

The detection limit DL of DFC-8-AQ for M²⁺ (M = Mg and Zn) was determined from 3σ method by following equation: $DL = K \cdot Sb_1/S$

Where K = 2 or 3 (we take 3 in this case); Sb₁ is the standard deviation of the blank solution; S is the slope of the calibration curve obtained from Linear dynamic plot of FI vs. [M²⁺].

Figure S9a. Determination of Sb₁ or the blank, DFC-8-AQ solution.

Figure S9b. Linear dynamic plot of FI at 526 nm vs. $[Mg^{2+}]$ for the determination of S (slope); [DFC-8-AQ] = 20 μ M

$$\text{LOD } (Mg^{2+}) = (3 \times 0.011) / 1.615 \times 10^7 = 2.04 \text{ nM}$$

Figure S9c. Linear dynamic plot of FI at 539 nm vs. [Zn²⁺] for the determination of S (slope); [DFC-8-AQ] = 20 μM

$$\text{LOD (Zn}^{2+}\text{)} = (3 \times 0.011) / 5.68 \times 10^6 = 5.81 \text{ nM}$$
