Figure S-1: Pictorial representation for making the plastic chip electrode.

FigureS-2: Profilogram recorded from the graphene stacks by TEM.

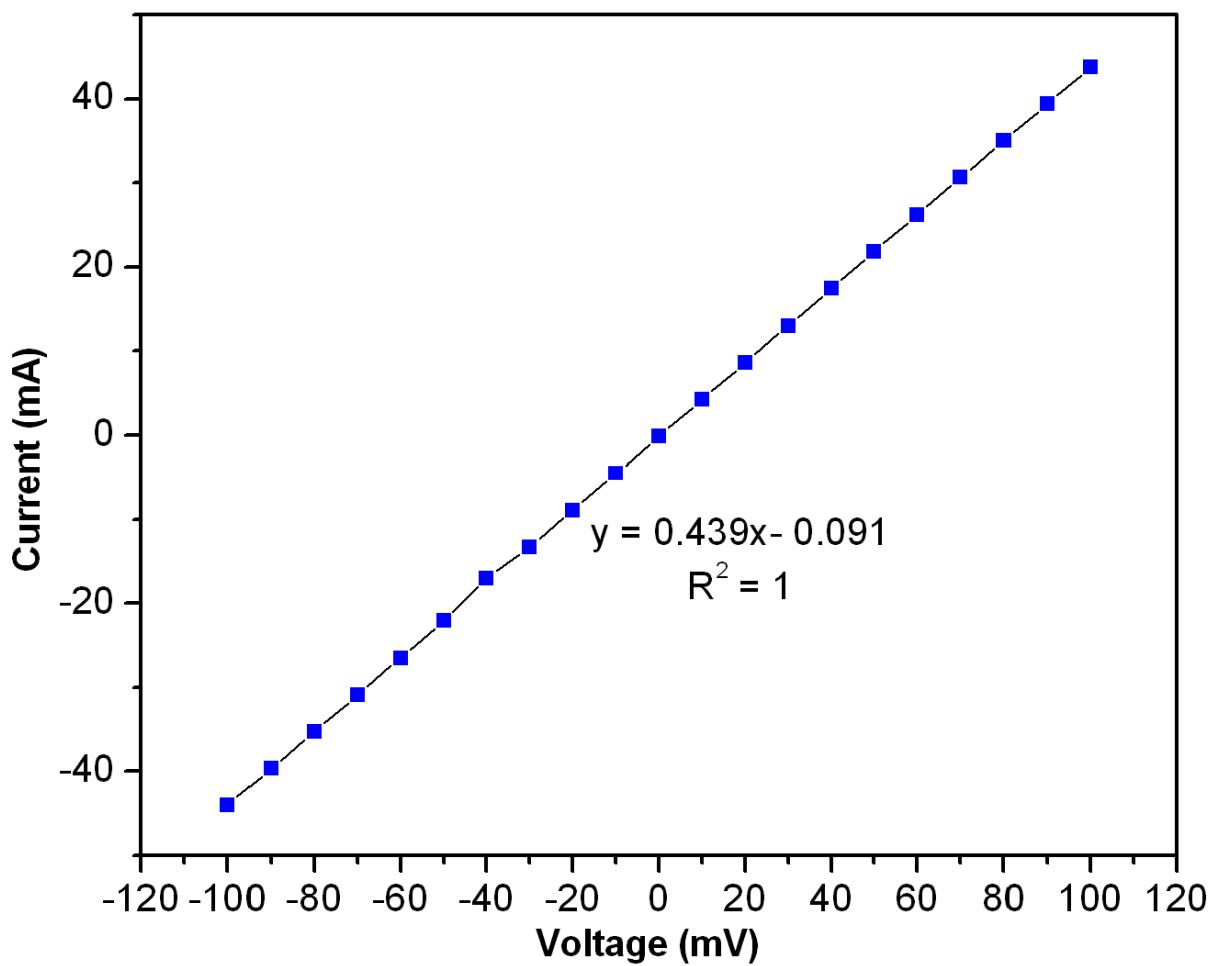

Figure S-3: I-V plot for plastic chip electrode.

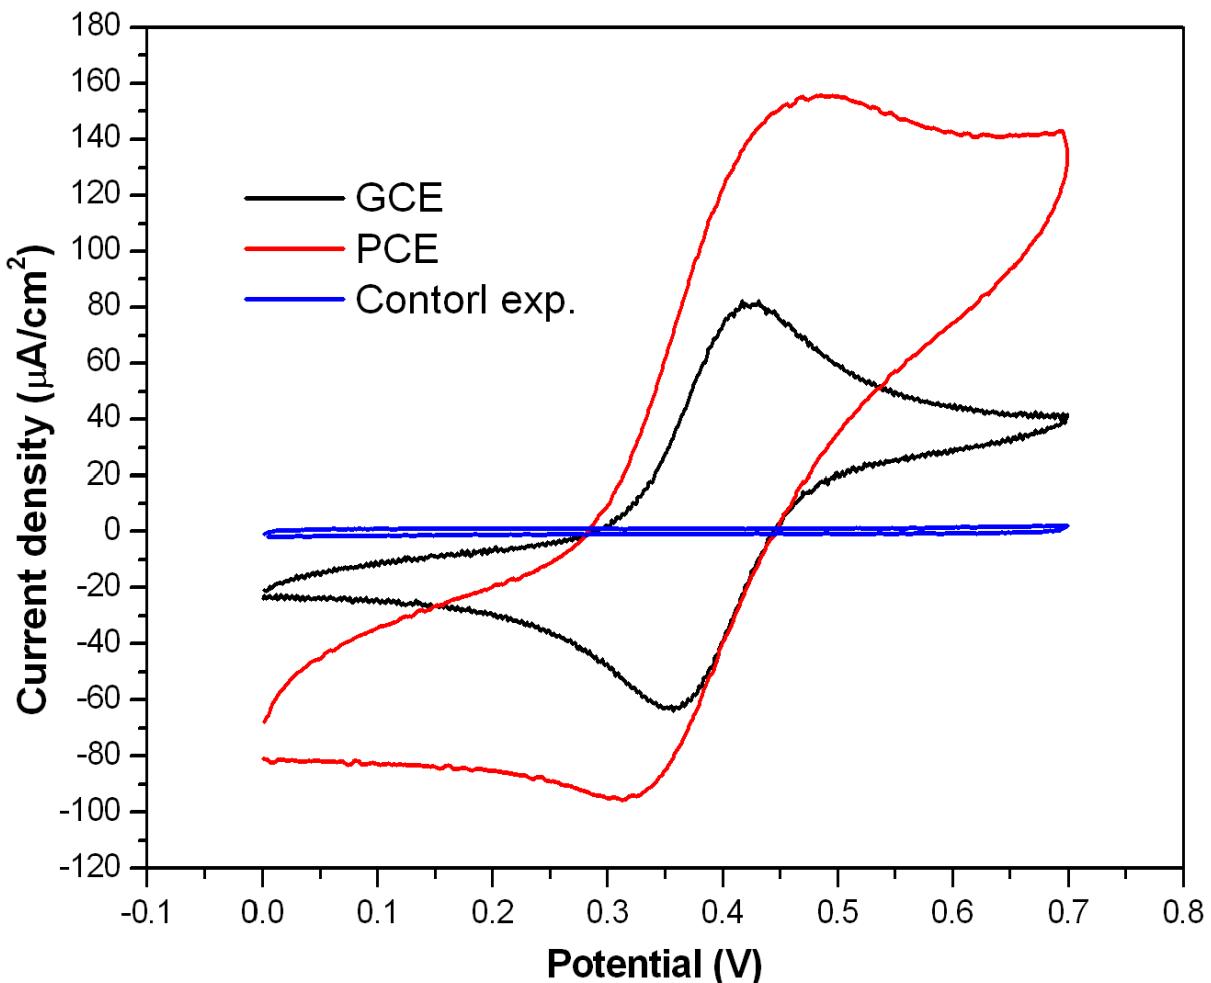

Figure S-4: Cyclic voltammogram of ferrocene/frrocenium redox couple using plastic chip electrode (red curve) and glassy carbon electrode (black curve). Experimental condition: Working solution- 3mM ferrocene carboxylic acid in 0.1 M potassium nitrate, counter electrode-Pt, reference electrode- Ag/AgCl (sat KCl), scan rate- 100mV/s. The blue curve shows blank scan in supporting electrolyte without analyte using PCE.

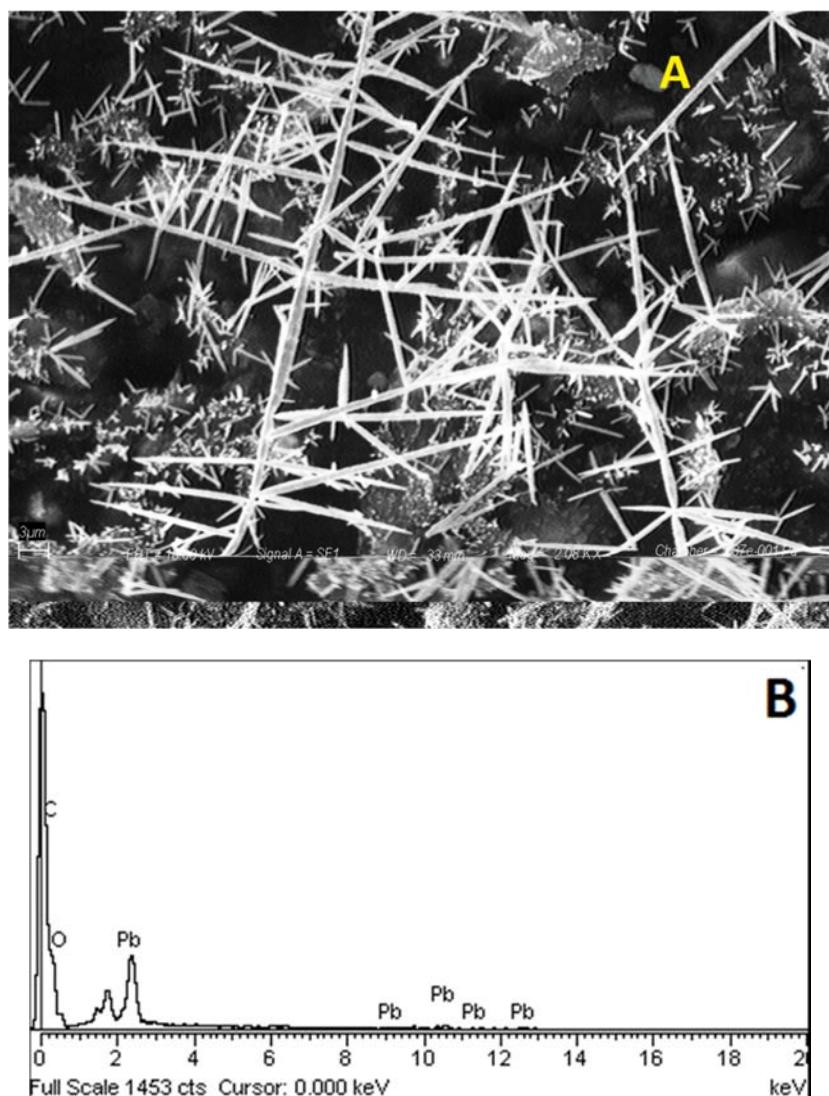

Figure S-5: (A) SEM image of plastic chip electrode after lead deposition; (B) EDX map of same showing presence of lead.

Figure S-6: SEM image of plastic chip electrode after zinc deposition. (A) Low resolution, (B) high resolution and (C) EDX spectra.

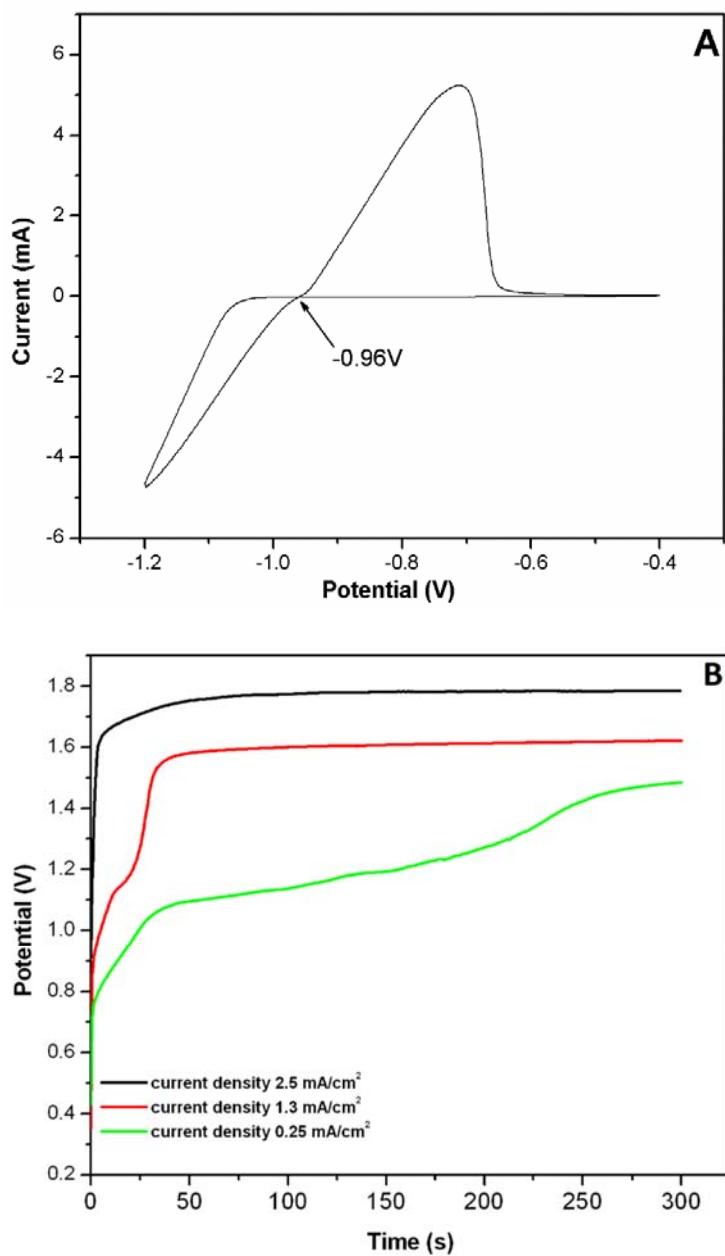

Figure S-7: Cyclic voltammogram of Zn^{+2} showing crossover potential (A) and chronopotentiometric curve for electrodeposition of zinc (B) on plastic chip electrode. Experimental condition: Working solution- kidd creek zinc electrolyte, Pt, reference electrode- Ag/AgCl (sat KCl), scan rate (for CV) - 100mV/s, current density (for electrodeposition) – 2.5, 1.3 & 0.5 mA/cm^2 (black, red and green respectively).

Table T-1: Physical properties of plastic chip electrode.

Parameters	Measurement technique	Value
Young's Modulus (E_{mod}) GPa	Tensile test	0.95 ± 0.1
Tensile Strength (σ_{ult}) MPa	Tensile test	20.5
Tensile Strain (ϵ^u) %	Tensile test	4.1
On set temperature (0C)	TGA	346.2
Residual mass (M_{res}) %	TGA	56.99
Conductivity (mS/cm)	I-V measurement	19.75
Average roughness (nm)	AFM	4.775
Area peak-to-valley height (nm)	AFM	50.216

Table T-2: The redox parameters derived from the cyclic voltammogram of ferrocyanide/fericyanide; $[\text{Ru}(\text{bpy})_3]^{+2}/[\text{Ru}(\text{bpy})_3]^{+3}$ and ferrocene/ frrocenium redox couples.

Scan rate	$[\text{Fe}(\text{CN})_6]^{+2/+3}$				$[\text{Ru}(\text{bpy})_3]^{+2/+3}$				ferrocene/ frrocenium
