## 1 Synthesis

## General Experimental Methods:

All reagents, solvents and Proteins have been purchased from Sigma Aldrich and were used without further purification unless otherwise specified. Preparation of air- and moisturesensitive materials was carried out in oven dried flasks under a nitrogen atmosphere using Schlenk techniques. Column chromatography was performed using Standard Grade silica gel 60 Å. Compounds 2, 4, and 9 were prepared as reported. ${ }^{1}{ }^{1} \mathrm{H}$ NMR spectra were recorded at 298 K on a $300,400,500$ or 600 MHz spectrometer, and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a 75,100 , 125 or 150 MHz spectrometer. Chemical shifts ( $\delta$ ) are reported in parts per million (ppm) relative to traces of $\mathrm{CHCl}_{3}$. MS spectra were recorded using fast atom bombardment, electronspray ionization or electron impact detected by magnetic sector and FT-ICR techniques, respectively. Infrared (IR) spectra are reported in wavenumbers $\left(\mathrm{cm}^{-1}\right)$ and were recorded neat. Absorption spectra were recorded in a rectangular quartz cuvette (light path $=10 \mathrm{~mm}$ ) on a Jasco UV-VIS V-660 spectrophotometer. Fluorescence spectra were recorded in a conventional quartz cuvette ( $10 \times 10 \times 40 \mathrm{~mm}$ ) on a Jasco FP-6500 fluorospectrometer. Photographs were taken with a Canon EOS 7D (objective: EF-S60mm f/2.8 Macro USM) with shutter speed 0.10 s .

### 2.4 Linear Discriminant Analysis

LDA was performed after 1 h reaction time of buffered aqueous solutions ( $\mathrm{pH} 11, \mathrm{c}=4.4 \mu \mathrm{M}$ ) of $\mathbf{3 , 4}$ and 10 with albumins or protein shakes ( $c=0.25 \mathrm{~g} / \mathrm{L}$ ). The final concentrations for fluorescence measurements were $A=0.038$ at 280 nm , which was calibrated using UV/vis spectroscopy. The fluorescence intensity values at 495 nm (albumins) and at 465 nm (protein shakes) were recorded with excitation at 380 nm . This process was repeated for each protein target to generate five replicates of each. Thus, the five albumins (or six protein shakes) were tested against a three fluorophore array ( $\mathbf{3}, \mathbf{4}$ and 10) five times to afford a data matrix of 3 fluorophores $\times 5$ albumins (or 6 shakes) $\times 5$ replicates. To obtain a fluorescence reference value the pure buffered fluorophore solution was measured at $A_{280}=$ 0.038 and subtracted from the fluorescence response in presence of analytes. The data matrix was processed using classical linear discriminant analysis (LDA) in SYSTAT (version 13.0). In LDA, all variables were used in the model (complete mode) and the tolerance was set as 0.001 . The fluorescence response patterns were transformed to canonical patterns. The Mahalanobis distances of each individual pattern to the centroid of each group in a multidimensional space were calculated and the assignment of the case was based on the shortest Mahalanobis distance. For the blind experiment another 18 unknown albumin samples were subjected to analysis via LDA and treated equally to the training cases. The protein sample preparation, data collection and analysis via LDA were carried out by different persons.

Table S1. Training matrix of fluorescence response patterns of the three DSB array (3, 4 and 10) against five albumin analytes with identical absorption values of $A=0.038$ at 280 nm measured with the same excitation wavelength ( 380 nm ). Fluorescence response was recorded at 495 nm and LDA was carried out as described above resulting in the three factors of the canonical scores and group generation.
