### Synthesis of AuNPs and AgNPs

AuNPs of different sizes were prepared according to a previously reported protocol. Briefly, 100 mL of 0.01% HAuCl<sub>4</sub> solution in 250 mL flask was put into a water bath. When the solution was heated to its boiling point, a certain volume of 1% sodium citrate was added into it under vigorous stirring. After 30 min of boiling incubation, the solution was cooled down to the room temperature. As we known, different volumes of sodium citrate lead to different size of AuNPs. In this experiment, we added 3 mL, 1.5 mL, 1 mL, 0.85 mL and 0.7 mL of 1% sodium citrate respectively to produce five different gold nanoparticles with diameters of 10-60nm (NP1-NP5). As for silver nanoparticles, it was also prepared based on the literatures described before. In brief, ammonia water was added to 1 mL of 0.1mol/L AgNO<sub>3</sub> dropwise until the precipitate disappeared. The solution was then diluted to 10 mL with ultrapure water and the final solution was 0.01 mol/L Tollens' reagent. Then 2 mL 0.05mol/L glucose and 0.5 g β-cyclodextrin were mixed together. Subsequently, 1.0 mL and 0.9 mL Tollens' reagent were added into the mixture, respectively and diluted to 50 mL with ultrapure water. After the mixture was heated to its boiling point under rapid stirring for 20 min and cooled down to room temperature, two types of AgNPs were obtained. The absorbance spectrum of synthesized nanoparticles are illustrate in Figure S1. The sizes and shapes of synthesized nanoparticles were characterized using transmission electron microscopy (TEM) at 200kV. The diameters of gold and silver nanoparticles are 13nm, 25nm, 35nm, 50nm, 60nm, 25nm, and 31nm, respectively (Figure S2).

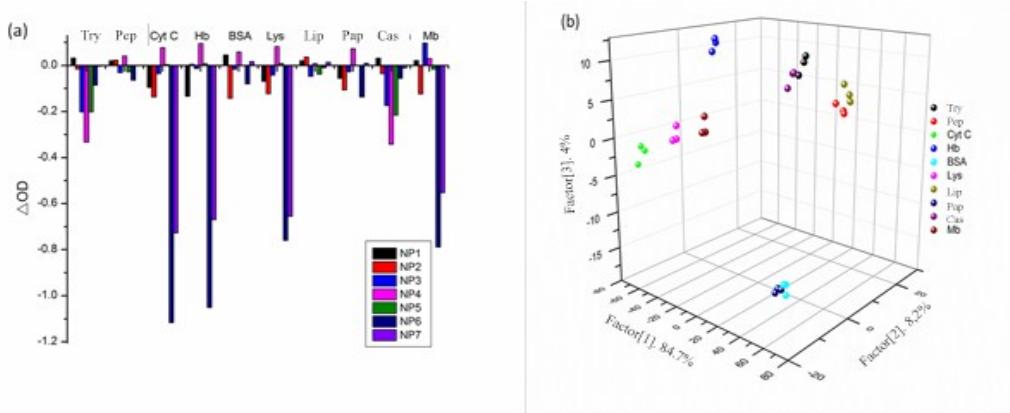

**Figure S1** The absorbance spectrum of the synthesized gold and silver nanoparticles.

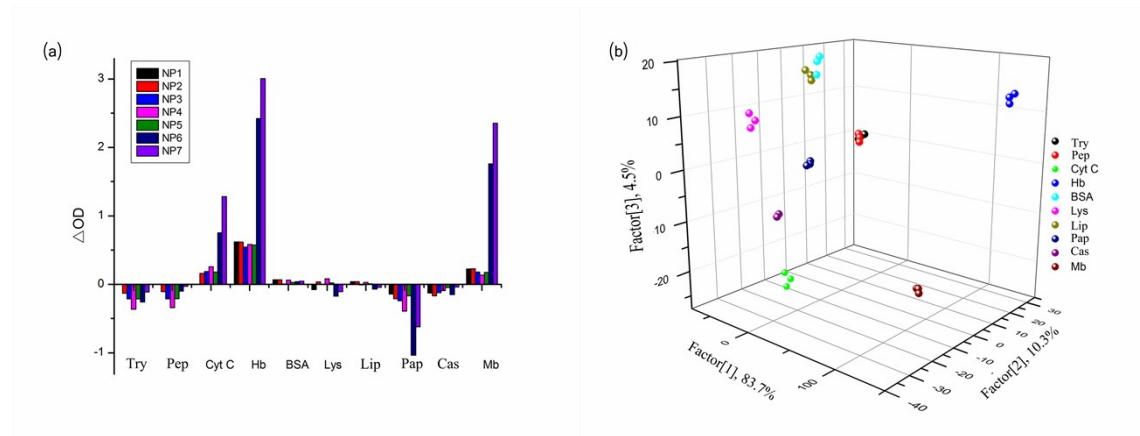

**Figure S2** Transmission Electron Microscopy image of gold and silver nanoparticles.

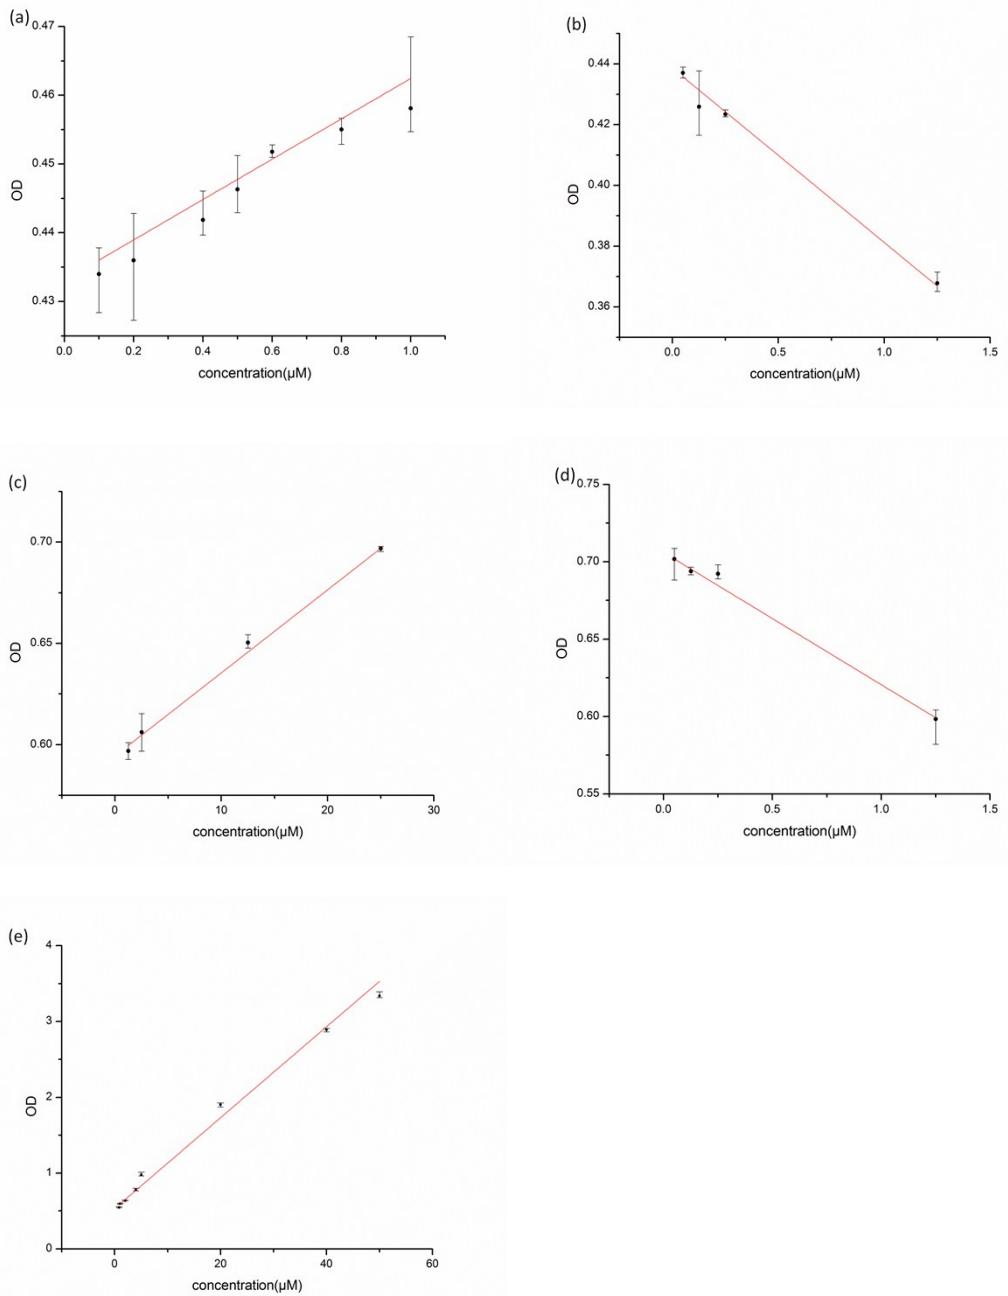

(a)-(e): AuNPs nanoparticles of five different sizes; (f)-(g): AgNPs nanoparticles of two different sizes.

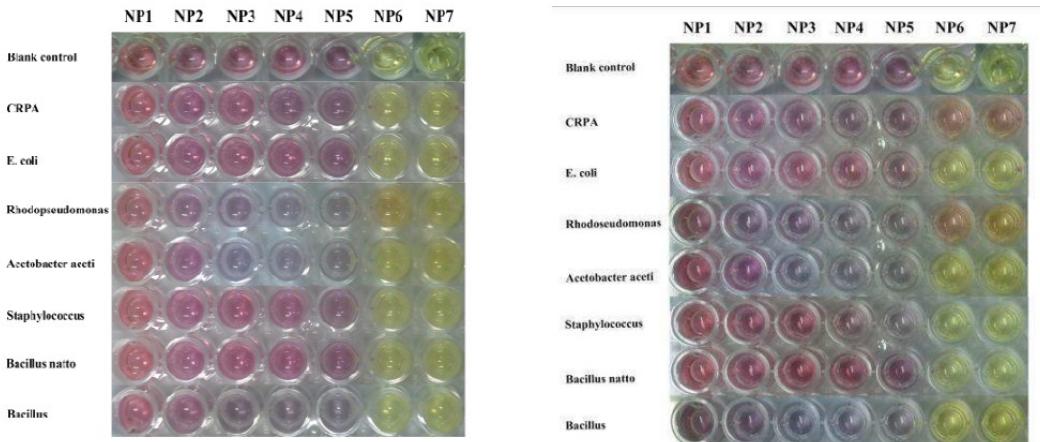

**Figure S3.** Protein identification with the colorimetric sensor array. (a) Absorbance response patterns of seven noble nanoparticles against ten proteins (all at  $0.5 \mu M$ ): trypsin (Try), pepsin (Pep), cytochrome C(Cyt C), hemoglobin (Hb), bovine serum albumin (BSA), lysozyme (Lys), lipase (Lip), papain (Pap), casein (Cas) and myoglobin (Mb). (b) Canonical score plot for the noble nanoparticles-based sensor array. All the proteins were clearly identified except a little overlap of Pap and BSA.

**Figure S4.** Protein identification with the colorimetric sensor array. (a) Absorbance response patterns of seven noble nanoparticles against ten proteins (all at  $50 \mu M$ ): trypsin (Try), pepsin (Pep), cytochrome C(Cyt C), hemoglobin (Hb), bovine serum albumin (BSA), lysozyme (Lys), lipase (Lip), papain (Pap), casein (Cas) and myoglobin (Mb). (b) Canonical score plot for the noble nanoparticles-based sensor array. All the proteins were clearly identified except overlap of Pep and Try.

**Figure S5.** Quantitative analysis of proteins. (a) Linear response of Try on NP1. (b) Linear response of Pap on NP1. (c) Linear response of Cyt C on NP3. (d) Linear response of Pep on NP4. (e) Linear response of Mb on NP7.

**Figure S6.** The color change patterns of noble nanoparticles against different bacteria

After 20mins (Left); After 6 hours (Right)

NP1: 15 nm AuNPs; NP2: 25 nm AuNPs; NP3: 35 nm AuNPs; NP4: 50 nm AuNPs; NP5: 60 nm AuNPs; NP6: 25nm AgNPs; NP7: 31nm AgNPs

**Table S1.** Absorbance response patterns of different proteins (all at 0.5  $\mu\text{M}$ ) against noble metal nanoparticle-based sensor array (NP1-NP7).
