

Supplementary Information

After spectral preprocessing, the interval partial least squares (iPLS) and the synergy interval partial least square (SiPLS) algorithms were used to perform the variables selection for extracting useful information and improving the model performance. The optimal wavebands were assigned according to the lowest value of the root mean squared error cross validation (RMSECV). The results are shown in

Table S1.

Table S1 variables selection results for NIR spectrum

Intervals numbers	RMSECV		
	SiPLS		iPLS

40	0.1062	0.1237	0.1250

The results after different variables selection methods are shown in **Table S2**. They indicated that the PLS model without any variables selection showed the best calibration and validation performance.

Table S2 Results for different variables selection methods after 1std+S-G preprocessing

Method	LVs	r_{cal}	RMSEC	RMSECV	BIAS _{cal}	r_{val}	RMSEP	RPD	BIAS _{val}
PLS	5	0.9959	0.066	0.160	0.053	0.9492	0.137	3.10	0.101
