1. General Methods

^1H - and ^{13}C -NMR spectra were recorded in CDCl_3 solution on a Bruker Avance 500 spectrometer at 20~25 °C. ^1H NMR spectra were reported in parts per million using tetramethylsilane TMS ($\delta = 0.00$ ppm) as an internal standard. The data of ^1H NMR are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, quin = quintet, m = multiplet), coupling constants (J , Hz), and integration. ^{13}C NMR spectra were reported in parts per million using solvent CDCl_3 ($\delta = 77.2$ ppm) or DMSO ($\delta = 39.5$ ppm) as an internal standard, The data of ^{13}C NMR are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, quin = quintet, m = multiplet), and coupling constants (J , Hz). High resolution mass spectra (HRMS) were obtained with a Q-TOF MS spectrometer. Reactions were monitored by TLC and column chromatography was performed using silica gel. Commercially available reagents were used without further purification unless otherwise specified.

2. Experimental Procedures

2.1 General procedure for synthesis of 1e, 1f, 1m, 1n and 1o-s

Compound **1** were synthesized according to the reported method:¹ To a flask containing a stirred mixture of Ph_3P (0.314 g, 1.2 mmol) and DDQ (0.272 g, 1.2 mmol) in dichloromethane (5 mL) was added aniline (1.2 mmol) at room temperature. Alcohol (1.0 mmol) was then added to the reaction mixture. TLC monitoring showed the completion of the reaction. The solvent was evaporated and the residue was chromatographed on a silica gel column to give secondary amine.

2.2 General procedure for synthesis of 2

Alcohol (3.75 mmol), TMSCN (0.272 mL, 2 mmol) and ferrous oxalate (0.007 g, 0.05 mmol) were successively added to the stirred solution of secondary amine **1** (0.5 mmol) in a seal tube at room temperature. After addition of TBHP (0.3 mL, 2 mmol, $\geq 65\%$ in *tert*-butanol), the mixture was stirred at room temperature for 4 h or rose to 90 °C for overnight. Subsequently, the mixture was poured into aqueous NaHCO_3 and $\text{Na}_2\text{S}_2\text{O}_3$ solution, and extracted with ethyl acetate. The organic layer was washed with brine, dried over magnesium sulfate and concentrated in vacuo. The residue was chromatographed on a silica gel column to give α -aminonitrile **2**.
