| Compound 3 | 67.17\% | TBHP | 7 | 96.68 | This article |

Figure. S17 a) the advantage $\{111\}$ facets in the XRD of 1, (inset: the space filling structure of advantage $\{111\}$ facets in $\mathbf{1} ; \mathbf{b}$ ) the advantage $\{002\}$ facets in the XRD of $\mathbf{2}$, (inset: the space filling structure of advantage $\{002\}$ facets in $\mathbf{2} ; \mathbf{c}$ ) advantage $\{-111\}$ facets in the XRD of $\mathbf{3}$, (inset: the space filling structure of advantage $\{-111\}$ facets in 3 .

Figure. S18 (a) catalyst can be recovered from the reaction vessel by centrifugal separation; (b) nanocrystal 2 dispersed in reaction system.

Figure. S19 XPRD patterns of compound 2: (a) simulated, (b) as-synthesized, (c) nanocrystal 2, (d) nanocrystal 2 after catalytic reaction.

Figure. S20 FT/IR spectrum of nanocrystal 2 (a)before catalysis; (b) after catalysis.

Figure. S21 UV-vis absorption spectra of $\mathrm{K}_{5}\left[\mathrm{BW}_{12} \mathrm{O}_{40}\right]$ (black) and nanocrystal 2 (red) in (a) water, (b) acetonitrile, (c) dichloromethane, (d) $n$-octane. These results suggest that $\mathrm{K}_{5}\left[\mathrm{BW}_{12} \mathrm{O}_{40}\right]$ can totally dissolve in $\mathrm{H}_{2} \mathrm{O}$ and slightly dissolve in other solvent systems, but all show characteristic peaks in the UV-vis spectra. However, the nanocrystal $\mathbf{2}$ cannot dissolve in above solvents and no signals can be observed in the UV-vis spectra.

Figure. S22 Removal of DBT versus reaction time by using nano-crystalline $\mathbf{2}$ and heat-treatment nano-crystalline $\mathbf{2}$ as catalysts. The nano-crystalline $\mathbf{2}$ as the representative sample has been heattreated at $130^{\circ} \mathrm{C}$ for 12 h , the heat-treated sample shows the similar catalytic activity to the one of as-prepared nanocrystalline $\mathbf{2}$, suggesting that the L-acid center may have no obvious effect on the catalytic activity of the catalyst.

### 3.3 The preparation of nanocrystal 2.

In a typical process, a mixture of $\mathrm{K}_{5} \mathrm{BW}_{12} \mathrm{O}_{40} \cdot \mathrm{n}_{2} \mathrm{O}(0.4 \mathrm{~g}, 0.13 \mathrm{mmol}), \mathrm{Co}(\mathrm{OAc})_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}(0.102 \mathrm{~g}$, $0.4 \mathrm{mmol})$, and BBTZ ( $0.15 \mathrm{~g}, 0.625 \mathrm{mmol}$ ) was dissolved in 10 mL of distilled water at room temperature and stirred for 0.5 h . The pH of the reaction mixture was adjusted to about 3.0 with 1.0 M HCl . Then, the surfactant hexadecyl trimethyl ammonium bromide (CTAB, $10 \mathrm{mg}, 0.027 \mathrm{mmol}$ ), polyvinyl pyrrolidone ( $\mathrm{PVP}, 10 \mathrm{mg}$ ), sodium docecyl sulfate ( $\mathrm{SDS}, 10 \mathrm{mg}, 0.035 \mathrm{mmol}$ ) was added, respectively. The suspension was sealed in a $23-\mathrm{mL}$ Teflon-lined autoclave and heated at $140^{\circ} \mathrm{C}$ for 3 days. After fast cooling to room temperature, the red-brown crystalline solid was filtered, washed with distilled water and ethanol alternately, and dried in an oven at $60^{\circ} \mathrm{C}$ for 24 h . The XPRD suggest that powders obtained by using CTAB and PVP were not in agreement with that of the single crystal 2 (Figure S24), while that of SDS are well in agreement with the one of single crystal 2 (Figure S19). It is presumed that the charge and size of the surfactants may affect the final products. Usually, the cationic surfactant for example CTAB has strong electrostatic interaction with the polyoxoanions and wrap the POM untis. The surfactants with large size (for example PVP) may also wrap the ployoxoanions, which affect the growth of nanocrystals.

Figure. S23 The EDX spectrums of nanocrystal 2. The EDX spectra confirmed the main composition of nanocrystal $\mathbf{2}$ and a Co / W atomic ratio of $\sim 0.2$ was suggested by EDX quantitative analysis.

Figure. S24 XPRD patterns of powder obtained by using CTAB(in red) and PVP (in black).

## 4. Additional physical characterization for compound 1-3

### 4.1 FT-IR spectra

The IR spectra of compounds $\mathbf{1 - 3}$ are shown in Figure S25- S27. In the spectrum of compound 1, there are four characteristic peaks of $\left[\mathrm{PW}_{12} \mathrm{O}_{40}\right]^{3-}$ which can be attributed to the vibrations of $v(\mathrm{P}-\mathrm{O}), v(\mathrm{~W}=\mathrm{Od})$ and $v(\mathrm{~W}-\mathrm{Ob} / \mathrm{c}-\mathrm{W})$ appearing at $1078,975,898,804 \mathrm{~cm}^{-1}$. In the spectrum of compound 2, four characteristic peaks of $\left[\mathrm{BW}_{12} \mathrm{O}_{40}\right]^{5-}$ are observed in the range of $1000-700 \mathrm{~cm}^{-1}$. The peaks at $1017 \mathrm{~cm}^{-1}, 979 \mathrm{~cm}^{-1}, 924 \mathrm{~cm}^{-1}$, and $799 \mathrm{~cm}^{-1}$ are ascribed to the vibrations of $v(\mathrm{~B}-\mathrm{O}), v(\mathrm{~W}=\mathrm{Od})$ and $v(\mathrm{~W}-\mathrm{Ob} / \mathrm{c}-\mathrm{W})$, respectively. In the spectrum of compound 3, the characteristic peaks for $v(\mathrm{~B}-\mathrm{O}), v(\mathrm{~W}=\mathrm{Od})$ and $v(\mathrm{~W}-\mathrm{Ob} / \mathrm{c}-\mathrm{W})$ of the polyoxoanion occur at 999 $\mathrm{cm}^{-1}, 950 \mathrm{~cm}^{-1}, 902 \mathrm{~cm}^{-1}$, and $821 \mathrm{~cm}^{-1}$. In addition, for this three compounds, the peaks at ca. 3129 $\mathrm{cm}^{-1}$ are attributed to to the vibrations of the $v(\mathrm{C}-\mathrm{H})$ in phenyl and triazole rings of BBTZ ligand. Peaks in the regions of $1624-1422 \mathrm{~cm}-1$ may belong to the vibrations of the $v(\mathrm{C}=\mathrm{C}), v(\mathrm{C}=\mathrm{N})$ and $v(\mathrm{C}=\mathrm{N})$ in phenyl and triazole rings of BBTZ ligand in 1-3. The peaks at ca. $3436 \mathrm{~cm}^{-1}$ are attributed to the vibrations of $v\left(\mathrm{H}_{2} \mathrm{O}\right)$.

Figure. S25 IR spectrum of compound 1.

Figure. S26 IR spectrum for compound 2.

Figure. S27 IR spectrum of compound 3.

### 4.2 Powder X-ray diffractions

In order to check the phase purity of compounds $\mathbf{1 - 3}$, the PXRD patterns of them were recorded at room temperature. As shown in Figure. S28-S30, the peak positions of simulated and experimental patterns of compounds 1-3 are in agreement with each other, indicating the good phase purity of them. The differences in intensity are due to the preferred orientations of the crystalline powder samples.

Figure. S28 XPRD patterns of compound 1: (a) simulated, (b) as-synthesized, (c) recovered after catalytic reaction of DBT.

Figure. S29 XPRD patterns of compound 2: (a) simulated, (b) as-synthesized, (c) recovered after catalytic reaction of DBT.

Figure. S30 XPRD patterns of compound 3: (a) simulated, (b) as-synthesized, (c) recovered after catalytic reaction of DBT.

### 4.3 TG Analyses

All TG measurements are performed under the atmosphere of air.
The TG curve of compound 1 also shows two weight loss stages (Figure. S31). The first weight loss of $1.76 \%$ in the temperature range of $50 \sim 200^{\circ} \mathrm{C}$ corresponds to the loss of one lattice water molecule and two coordinated water molecules (calcd. 1.74\%). The second weight loss from $362 \sim$
$820^{\circ} \mathrm{C}$ is ascribed to the loss of $\mathrm{C}, \mathrm{N}$ atoms and the formation of CoO and $\mathrm{WO}_{3}$. The whole weight loss of $20.49 \%$ is in agreement with the calculated value $20.43 \%$.
The TG curve of compound 2 shows two weight loss steps (Figure. S32). The first weight loss of $2.63 \%$ in the temperature range of $50 \sim 210{ }^{\circ} \mathrm{C}$ corresponds to the loss of four lattice water
molecules and two coordinated water molecules (calculated value $2.65 \%$ ). The second weight loss of $23.76 \%$ from 393 to $791^{\circ} \mathrm{C}$ is ascribed to the loss of $\mathrm{C}, \mathrm{N}$ atoms and the formation of $\mathrm{CoO}, \mathrm{WO}_{3}$ and $\mathrm{B}_{2} \mathrm{O}_{3}$. The whole weight loss of $26.39 \%$ is in agreement with the calculated value $26.21 \%$. The TG curve of compound 3 exhibits the first weight loss of $0.84 \%$ in the temperature range of 50 $\sim 220^{\circ} \mathrm{C}$ corresponding to the loss of four lattice water molecules (calcd. $0.85 \%$ ). The second weight loss in the range of $360 \sim 780^{\circ} \mathrm{C}$ is $29.03 \%$ and attributed to the loss of $\mathrm{C}, \mathrm{N}$ atoms and the formation of $\mathrm{CuO}, \mathrm{WO}_{3}$ and $\mathrm{B}_{2} \mathrm{O}_{3}$. The whole weight loss of $29.87 \%$ is in agreement with the calculated value 29.75\% (Figure S33).

Figure. S31 The TG curve of compound 1

Figure. S32 TG curve of compound 2

Figure. S33 TG curve of compound 3
5. The additional catalytic oxidation experiments of DBT in $\boldsymbol{n}$-octane

Figure. S34 Removal of DBT versus reaction time by using nano-crystalline $\mathbf{2}$ as catalyst in $n$ octane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, the results suggest that the nano-crystalline $\mathbf{2}$ still exhibit good catalytic activity on the oxidation of DBT, which is similar to those in the solvent $\mathrm{CH}_{2} \mathrm{Cl}_{2}$.

Figure. S35 The recycle experiments with nano-crystalline $\mathbf{2}$ as catalyst in model oil $n$-octane. The recycling experiments of nano-crystalline 2 in $n$-octane also have been investigated and the conversion of DBT still reached $96.3 \%$ after 5-times recycling without a significant decrease The slightly decrease of catalytic activity after reused for five cycles might be related to the slight loss of catalysts in the process of recycle.
