## Electronic Supplementary information

### Contents

#### Figure S1

Powder XRD patterns in the  $2\theta$  range of 30–60° for BaNbO<sub>2</sub>N treated using three different kinds of flux.

#### Figure S2

Powder XRD patterns for BaNbO<sub>2</sub>N treated using three different kinds of flux.

#### Figure S3

Schematic illustration of two-boat flux treatment setup.

#### Table S1

Elemental analysis (atomic ratio) results before and after flux treatment using alkali chlorides.

(1) XRD patterns for BaNbO<sub>2</sub>N treated using different alkali chloride fluxes

Figure S1 shows magnified regions of the XRD patterns in Figure 1 in the  $2\theta$  range of 30–60°. For BaNbO<sub>2</sub>N(NaCl), BaNbO<sub>2</sub>N(KCl) and BaNbO<sub>2</sub>N(RbCl), diffraction peaks associated with NbO<sub>x</sub>N<sub>y</sub> phases were also observed, indicating the chemical reduction of Nb species during the flux treatment. Figure S2 shows the  $2\theta$  range of 63–64.4°. Splitting of the (220) peak can be observed, corresponding to  $K_{\alpha 1}$  and  $K_{\alpha 2}$ . After the flux treatment, the splitting became more pronounced, indicating an improvement in crystallinity. The dashed line indicates the (220) peak position for BaNbO<sub>2</sub>N before treatment. For BaNbO<sub>2</sub>N(NaCl) and BaNbO<sub>2</sub>N(CsCl), the split peak shifted to higher and lower angles, respectively.

**Figure S1.** XRD patterns for BaNbO<sub>2</sub>N particles (a) before and after flux treatment with (b) LiCl, (c) NaCl, (d) KCl, (e) RbCl, and (f) CsCl. Square symbols (■) indicate NbO<sub>x</sub>N<sub>y</sub>.

**Figure S2.** XRD patterns for  $\text{BaNbO}_2\text{N}$  particles (a) before and after flux treatment with (b)  $\text{LiCl}$ , (c)  $\text{NaCl}$ , (d)  $\text{KCl}$ , (e)  $\text{RbCl}$ , and (f)  $\text{CsCl}$ .

## (2) Schematic illustration of two-boat flux treatment setup

Figure S3 shows a schematic illustration of the two-boat flux treatment setup. Two alumina boats were inserted inside an alumina tube and were heated under an  $\text{NH}_3$  flow. An  $\text{NaCl}$  flux and  $\text{BaNbO}_2\text{N}$  particles was placed in the upstream and downstream boats, respectively. During the flux treatment, both boats were heated to the same temperature.

**Figure S3.** Schematic illustration of two-boat flux treatment setup.

### (3) Elemental analysis

Elemental analysis results for BaNbO<sub>2</sub>N before and after flux treatment with NaCl, KCl, RbCl, and CsCl are shown in Table S1. The amount of Ba, Nb, and alkali metal (except Cs) was determined by ICP-AES. The amount of Cs was determined by XRF. The amount of O and N was determined by combustion analysis.

**Table S1.** Elemental analysis results (atomic ratio) before and after flux treatment using alkali chlorides.

Flux	Cation of flux	Ba <sup>a</sup>	Nb <sup>a</sup>	O <sup>b</sup>	N <sup>b</sup>
–	–	1.00	0.91	2.66	0.80
NaCl	0.05 <sup>a</sup>	1.00	1.11	2.24	1.11
KCl	0.02 <sup>a</sup>	1.00	1.04	2.03	1.03
RbCl	0.005 <sup>a</sup>	1.00	1.04	2.02	1.05
CsCl	0.03 <sup>c</sup>	1.00	1.02	2.07	1.00

<sup>a</sup> Determined by ICP analysis

<sup>b</sup> Determined by combustion analysis

<sup>c</sup> Determined by XRF analysis
