Table S6 shows a comparison to the G4 method,¹ which was requested by a reviewer. The G4 method is a wave function method with six empirical parameters; it uses geometries optimized by B3LYP, which has been found^{2,3} to be unreliable for transition state geometries. Furthermore the optimization is accomplished with small basis set (6-31G(2df,p)). Nevertheless, the table shows that the G4 results agree with M08-HX/MG3S ones within about 1 kcal/mol.
