2. The electronic structure of the g-CN/G nanocomposite

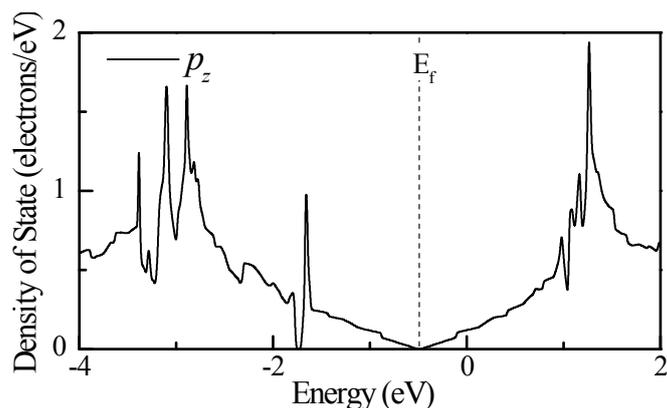

FIG. S1. The calculated partial density of state for C atoms belonged to graphene. The Fermi level is indicated by the dashed line.

3. The effect of E-field on the band gap of the g-CN/G nanocomposite

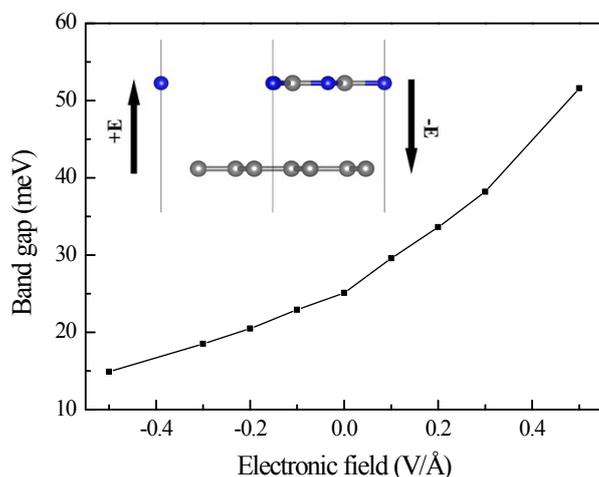

FIG. S2. Band gaps of the g-CN/G nanocomposite as a function of the external electric field (E-field). The results are calculated at the PBE level and the directions of the E-field is shown in the inset.

4. The changes in charge transfer with increasing interfacial distance

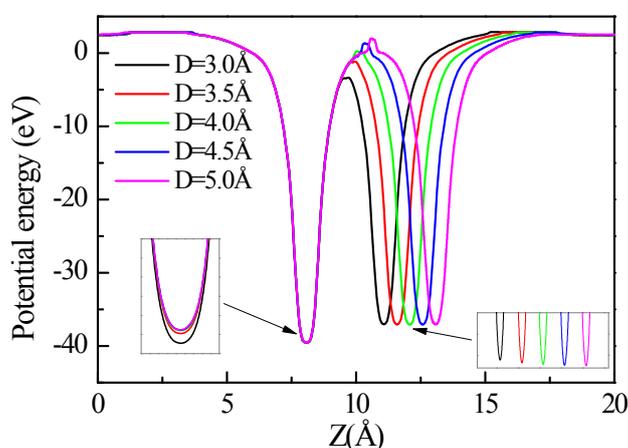

FIG. S3. XY-averaged electrostatic potentials of hybrid g-CN/G nanocomposite at different interfacial distances D

(Å) along the Z direction. Depths of potential wells of g-C₃N₄ and graphene are shown in the inset.

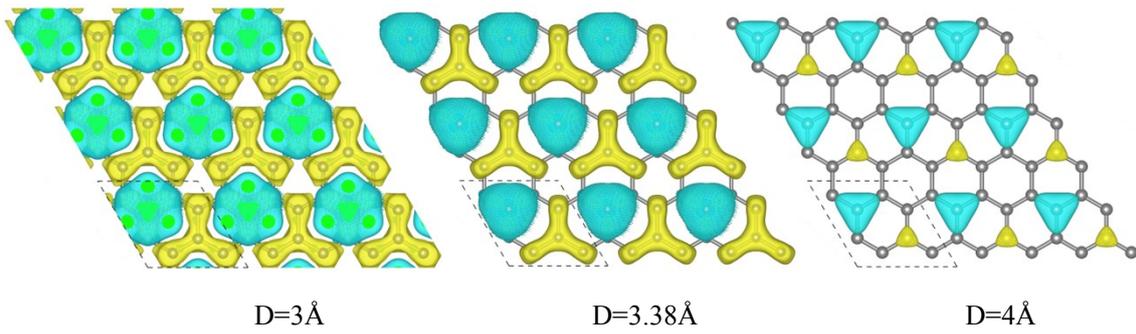

FIG. S4. The electron-hole puddle within graphene layer at different interfacial distances D (Å) along the Z direction. The yellow isosurface represents positive charge density and the cyan isosurface negative charge density. Isosurface is taken at a value of $0.0001 e/\text{Bohr}^3$.
