**Table S1.** DFT-calculated <sup>27</sup>Al NMR parameters  $\delta_{\text{ISO}}$  (ppm) and  $C_Q$  (MHz) for all monomeric species presented in Figure 1.

**Scheme S1.** Schematic representation of all models of Al monomers used in the 2D map:  $\text{AlMe}_3$ ,  $\text{AlMe}_2\text{Cl}$ ,  $\text{AlMeCl}_2$ ,  $\text{AlMe}_2\text{OH}$ ,  $\text{AlCl}_2\text{OH}$ ,  $\text{AlMe}(\text{OH})_2$ ,  $\text{AlCl}(\text{OH})_2$ ,  $\text{AlMeClOH}$ ,  $\text{Al}(\text{OH})_3$ ,  $\text{Al}(\text{OMe})_3$ ,  $\text{AlF}_3$ ,  $\text{Al}(\text{OSi}(\text{OH})_3)_3$ ,  $\text{AlMe}(\text{OSi}(\text{OH})_3)_2$ ,  $\text{AlMe}_2(\text{OSi}(\text{OH})_3)$ ,  $\text{AlMeCl}(\text{OSi}(\text{OH})_3)$ ,  $-\text{O}_{\text{SURF}}\text{AlMe}_2$ ,  $-\text{O}_{\text{SURF}}\text{AlMeCl}$ ,  $-\text{O}_{\text{SURF}}\text{AlCl}_2$ ,  $-\text{O}_{\text{SURF}}\text{AlMe}_2$ ,  $\text{O}_{\text{SURF}}$ ,  $-\text{O}_{\text{SURF}}\text{AlMeCl}$ ,  $\text{O}_{\text{SURF}}$ ,  $-\text{O}_{\text{SURF}}\text{AlCl}_2$ ,  $\text{O}_{\text{SURF}}$ ,  $(\text{O}_{\text{SURF}})_2\text{AlMe}$ ,  $(\text{O}_{\text{SURF}})_2\text{AlCl}$ .

## <sup>27</sup>Al SS-NMR for dimeric species

### Dimeric species in gas phase

**Figure S1** Relative energy as a function of the number of Cl for the dimers in gas phase with general formula  $\text{Me}_n\text{Cl}_{2-n}\text{Al}1(\mu^2\text{-Me}_n\text{Cl}_{1-n})\text{Al}2\text{Me}_n\text{Cl}_{2-n}$ . The small c and t, stand for cis and trans isomers, respectively. The crossed diamond represents Me in bridge position, the circle corresponds to mixed MeCl bridge, and the star shows that in bridge we have Cl. The position of the Cl atoms is indicated as in the main text of the paper.

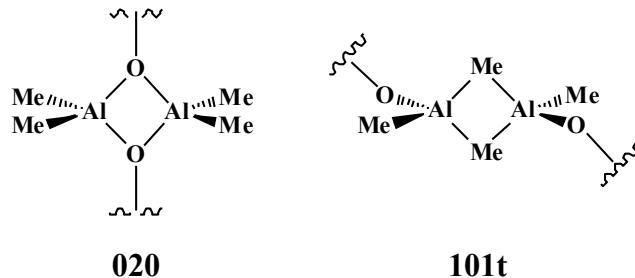

Species	Cl position	Relative energies of gas-phase dimers

**Table S7.** Relative energy differences for the bigrafted dimers- 2.3 (O<sub>SURF</sub>Me<sub>n</sub>Cl<sub>1-n</sub>Al1(μ-Me<sub>n</sub>Cl<sub>1-n</sub>O<sub>SURF</sub>)Al2Me<sub>n</sub>Cl<sub>2-n</sub>), 2.4 (Me<sub>n</sub>Cl<sub>2-n</sub>Al1(μ<sup>2</sup>-O<sub>SURF</sub>)Al2Me<sub>n</sub>Cl<sub>2-n</sub>), 2.5 (O<sub>SURF</sub>Me<sub>n</sub>Cl<sub>1-n</sub>Al1(μ-Me<sub>n</sub>Cl<sub>2-n</sub>)Al2Me<sub>n</sub>Cl<sub>1-n</sub>O<sub>SURF</sub>), and 2.6 (O<sub>SURF</sub>)<sub>2</sub>Al1(μ-Me<sub>n</sub>Cl<sub>2-n</sub>)Al2Me<sub>n</sub>Cl<sub>2-n</sub>.

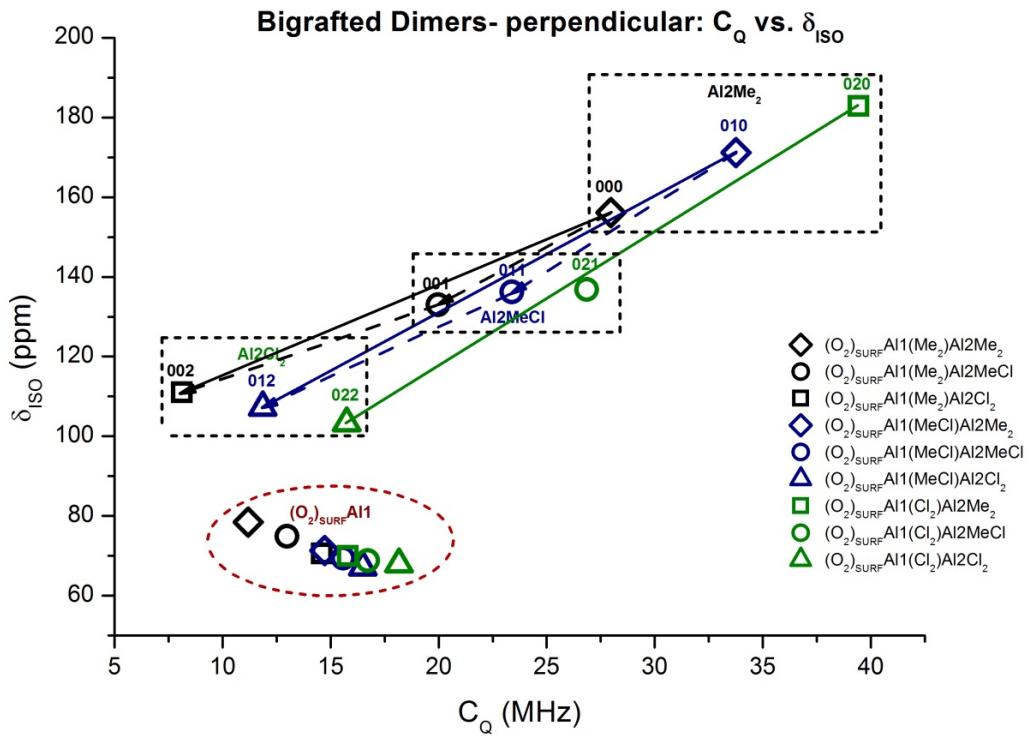

**Figure S3.** All methylaluminum bigrafted dimers and their chloro derivatives in which the Al-Al axis is parallel to the {001} silica surface.

For the 2.4 dimers ( $Me_nCl_{2-n}Al1(\mu^2-O_{SURF}) Me_nCl_{2-n}$ ) we see clearly the effect of the number of the Cl atoms. Starting from  $Me_2Al1(\mu^2-O_{SURF}) Me_2$  (where Al1 and Al2 are equivalent) we start from 167 ppm and 28 MHz, to 130 ppm and 21 MHz for the  $MeClAl1(\mu^2-O_{SURF}) MeCl$ , and ending with 99 ppm and 15 MHz for the  $Cl_2Al1(\mu^2-O_{SURF}) Cl_2$ . Along that linear correlation the  $\delta_{ISO}$  and the  $C_Q$  both shift towards the small values with 68 ppm and 13 MHz respectively. This is exactly what we would expect based on the already observed trend for the monografted dimers.

**Figure S4.** All methylaluminum bigrafted dimers and their chloro derivatives in which the Al-Al axis is parallel to the  $\{001\}$  silica surface.

**Figure S5.** All methylaluminum bigrafted dimers and their chloro derivatives in which the Al-Al axis is perpendicular to the  $\{001\}$  silica surface.
