Materials and methods

All reagents and solvents were purchased from commercial sources and used as received unless otherwise noted. Triethylamine (Et_3N) was distilled over potassium hydroxide and methylene dichloride was treated with CaH_2 before use. The synthesis of the bisporphyrin [$\text{Zn}_2\text{-1}$] is accomplished by following the literature method.¹

Elemental analyses (C, H and N) were performed with an ElementarVario EL III analytical instrument. ^1H NMR titration and ^1H NMR spectra were obtained at room temperature, using a Bruker AVANCE 400 MHz spectrometer in CDCl_3 with tetramethylsilane (TMS) as the internal standard; chemical shifts are expressed in ppm relative to TMS (0 ppm). Two-dimensional NMR spectra were recorded on Agilent 600MHz NMR instrument. Mass spectra were taken with Finnigan Accurate-Mass LCQTM. CD spectra were measured on an AVIV Model 410 spectropolarimeter. Scanning conditions were as follows: wavelength step=0.50 nm, bandwidth=2 nm, response time=0.1 s, averaging time=1.00 seconds, settling time=0.333 seconds.

General procedure for CD measurement

The background spectrum was taken from 390 nm to 440 nm with a scan rate of 100 nm/min at 295 K. Zinc bisporphyrinate solution (1.00 to 2.00×10^{-6} M, 2.50 mL) was injected into a 1 cm quartz cuvette. Then 1500 equivalents of the optically active monoamines were added into the above solution to form the corresponding complex. The CD spectra were measured after several minutes (minimum of 4 accumulations). The resultant ECCD spectra recorded in millidegrees were normalized based on the zinc bisporphyrinate concentration.

^1H NMR and CD titrations

The CD titration experiments were carried out as follows. Measurements have been performed by adding different aliquots of the optically active monoamines solution to the zinc-bisporphyrin solution in DCM at room temperature. Then the CD spectra were taken after each addition. The resultant ECCD spectra recorded in millidegrees were normalized based on the zinc bisporphyrinate concentration.

¹H NMR titration experiments were done as follows. Portions of a solution of the chiral monoamine in CDCl₃ were added to the solution of bisporphyrin (0.50 mL) in CDCl₃ in a 5 mm o.d. NMR tube and ¹H NMR spectra were taken after each addition.

X-ray structure determination

The measurements of a single crystal of [Cu₂-**2**] were made on Agilent Xcalibur diffractometer with an Atlas (Gemini Ultra Cu) detector by using graphite monochromated Cu Ka ($\lambda=0.154178$ nm) at 220(2) K. The measurements of a single crystal of [Zn₂-**3**] were made on a Bruker APEX-II CCD X-ray diffractometer by using graphite monochromated Mo Ka ($\lambda=0.071073$ nm) at 220(2) K. Both structures were solved by direct methods and refined on F² using full matrix least-squares methods with SHELXTL version 97.² All non-hydrogen atoms were refined anisotropically. In the asymmetric unit, all the hydrogen atoms were theoretically added and riding on their parent atoms. Complete crystallographic details, atomic coordinates, anisotropic thermal parameters, and fixed hydrogen atom coordinates are given in the CIF file. For [Cu₂-**2**], the asymmetric unit contains a half molecule of compound **2** and badly disorder solvent molecules. While SQUEEZE³ was used to model all disordered solvate. Electron counts within the interporphyrin voids of 399 e (corresponding to roughly to 2 molecules of CH₂Cl₂ and 2 molecules of H₂O per compound **2**). One phenyl ring was found disordered over two positions. The final refinement gave the occupancy of the major component of 60%. For [Zn₂-**3**], the asymmetric unit contains two molecules of compound **3** and badly disorder solvent molecules. While SQUEEZE¹² was used to model all disordered solvate. Electron counts within the interporphyrin voids of 1831 e (corresponding to roughly to 3 molecules of CH₂Cl₂ and 2 molecules of C₇H₁₆ per compound **3**). Details of the crystal parameters, data collection, and refinements are summarized in Table S1.

Computation methods.

Firstly, we performed DFT calculations on the free host [Zn₂-**1**] based on the crystal structure of [Zn₂-**1**]. Due to the asymmetric arrangement, the host molecules exist as a pair of enantiomers, conformers I and II as shown in Fig. S31. Then we did calculations on the corresponding host-guest complexes

formed between [Zn₂-1] (both conformers I and II) and chiral monoamine **1S** or **5S**.

Full optimizations on all conformations of possible complexes studied were performed at the semi-empirical Parameterized Model (PM6) with Gaussian09 programs.⁴ Some relatively stable minima's by PM6 were then subjected to geometry optimization at the B3LYP/6-31G* (gas phase) level of theory. The local minima with lowest energy at the level of B3LYP/6-31G* are reported in the current communication. We employed the density functional theory (DFT) with no symmetry constraints to investigate the optimized geometries. To confirm that each structure was a true minimum, vibrational analyses were performed.
