Optical contrast and cycling of bistable luminescence properties in $\text{Rb}_2\text{KIn}_{(1-x)}\text{Ce}_x\text{F}_6$ compounds

Lucile Cornu, Manuel Gaudon, Olivier Toulemonde, Philippe Veber, Véronique Jubera**

Figure S1. a) and b) Pictures of the crucible and the as-grown crystals after the crystal growth attempts for the 2 mol% and the 10 mol% targeted cerium content batch. c) and d) Pictures of LC and HC single crystals, respectively.

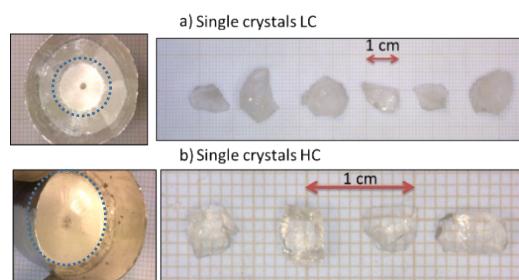

Figure S2. $M(H/T)$ corrected from diamagnetism from the sample holder and from Rb_2KInF_6 host collected at 100 K. The dots indicate the data and the lines correspond to the fit of the data.

a) Low concentrated cerium-doped Rb_2KInF_6 crystals ($[\text{Ce}] \ll 1\%$ molar, LC crystal),
b) 4.6% molar cerium-doped Rb_2KInF_6 crystals (HC crystal).

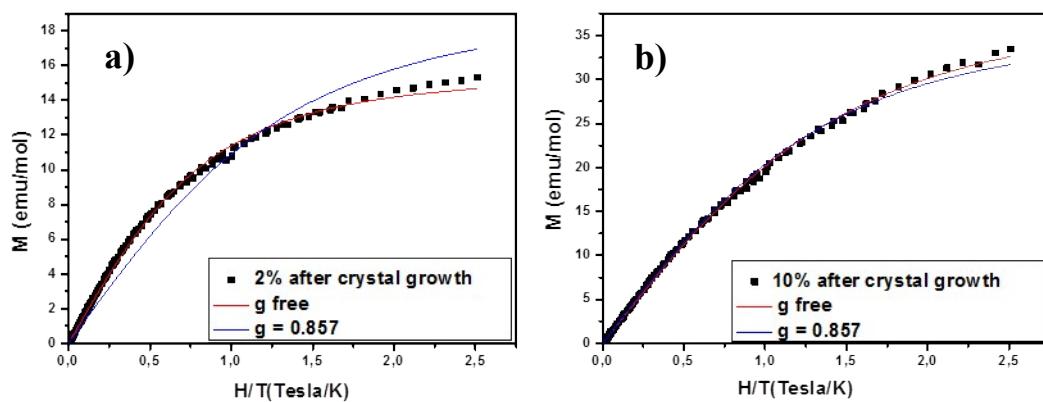

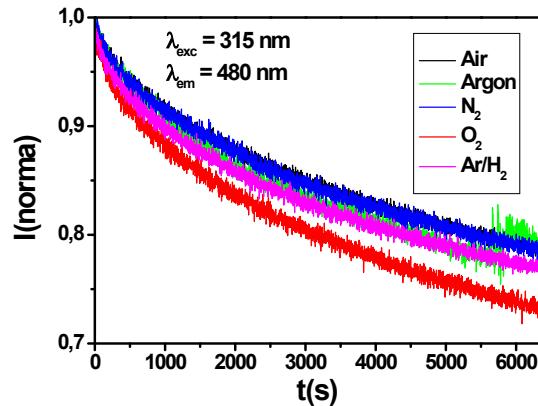

Figure S3. Kinetic of 4.6% cerium content Rb_2KInF_6 crushed crystal (HC) emission in various gas atmosphere for a) first step at $\lambda_{\text{exc}} = 315 \text{ nm}$ and $\lambda_{\text{em}} = 480 \text{ nm}$ (Ce^{3+} emission), and b) second step at $\lambda_{\text{exc}} = 255 \text{ nm}$ and $\lambda_{\text{em}} = 630 \text{ nm}$ (In^+ emission).

a)

b)

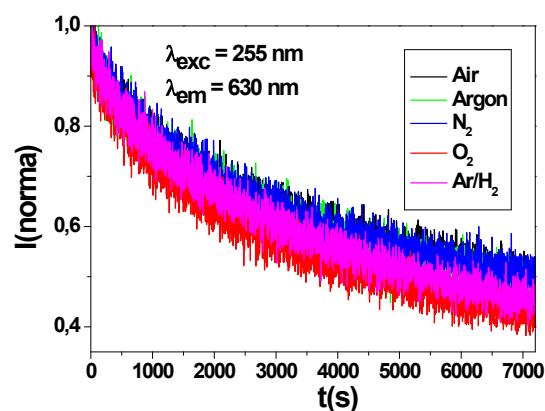

Figure S4. Irradiation Kinetic for a) <1% cerium content Rb_2KInF_6 crushed crystal (LC) under $\lambda_{\text{exc}} = 255 \text{ nm}$ and $\lambda_{\text{em}} = 630 \text{ nm}$, and b) 4.6% cerium content Rb_2KInF_6 crushed crystal (HC) under $\lambda_{\text{exc}} = 255 \text{ nm}$ and $\lambda_{\text{em}} = 650 \text{ nm}$.
