

Supplementary Information

Temporal analysis of *E. coli*, TSS and wastewater micropollutant loads from combined sewer overflows: implications for management

Madoux-Humery Anne-Sophie^{a*}, Sarah M. Dorner^b, Sébastien Sauvé^c, Khadija

Aboulnadl^c, Martine Galarneau^d, Pierre Servais^e, Michèle Prévost^a

Supplementary Information (SI):

Number of pages: 6

Number of figures: 4

Number of tables: 1

Figures

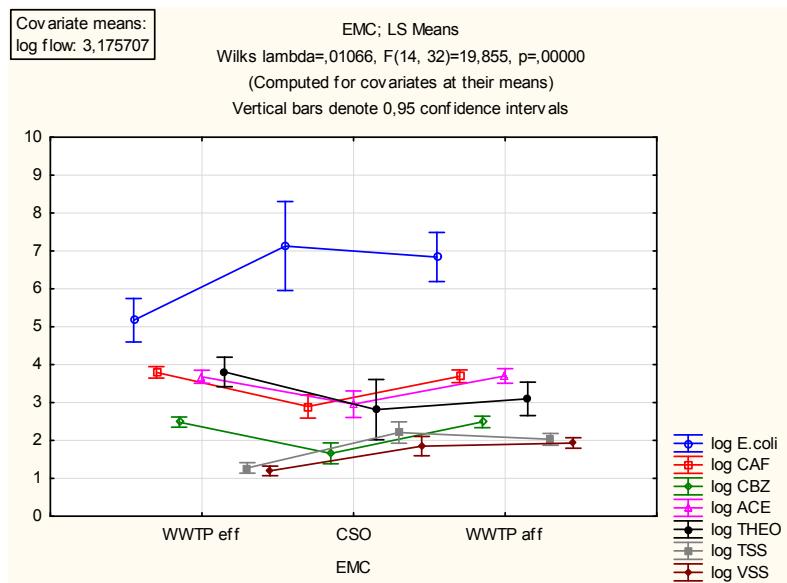

Figure S1: Responses vs EMC at the mean of Log Flow

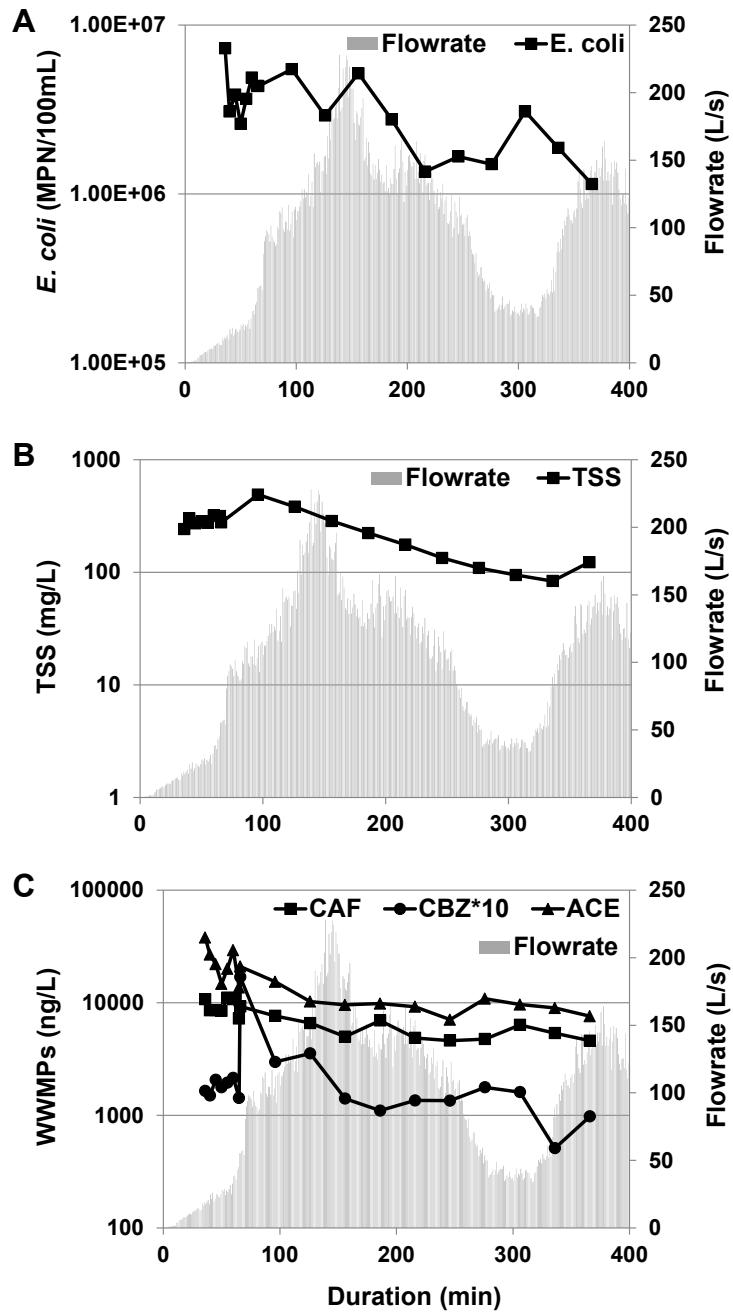

Figure S2: Concentrations of pollutants and fluctuations of the flowrate during an overflow event in snowmelt (#1). (A) *E. coli*, (B) TSS, (C) CAF, CBZ and ACE.

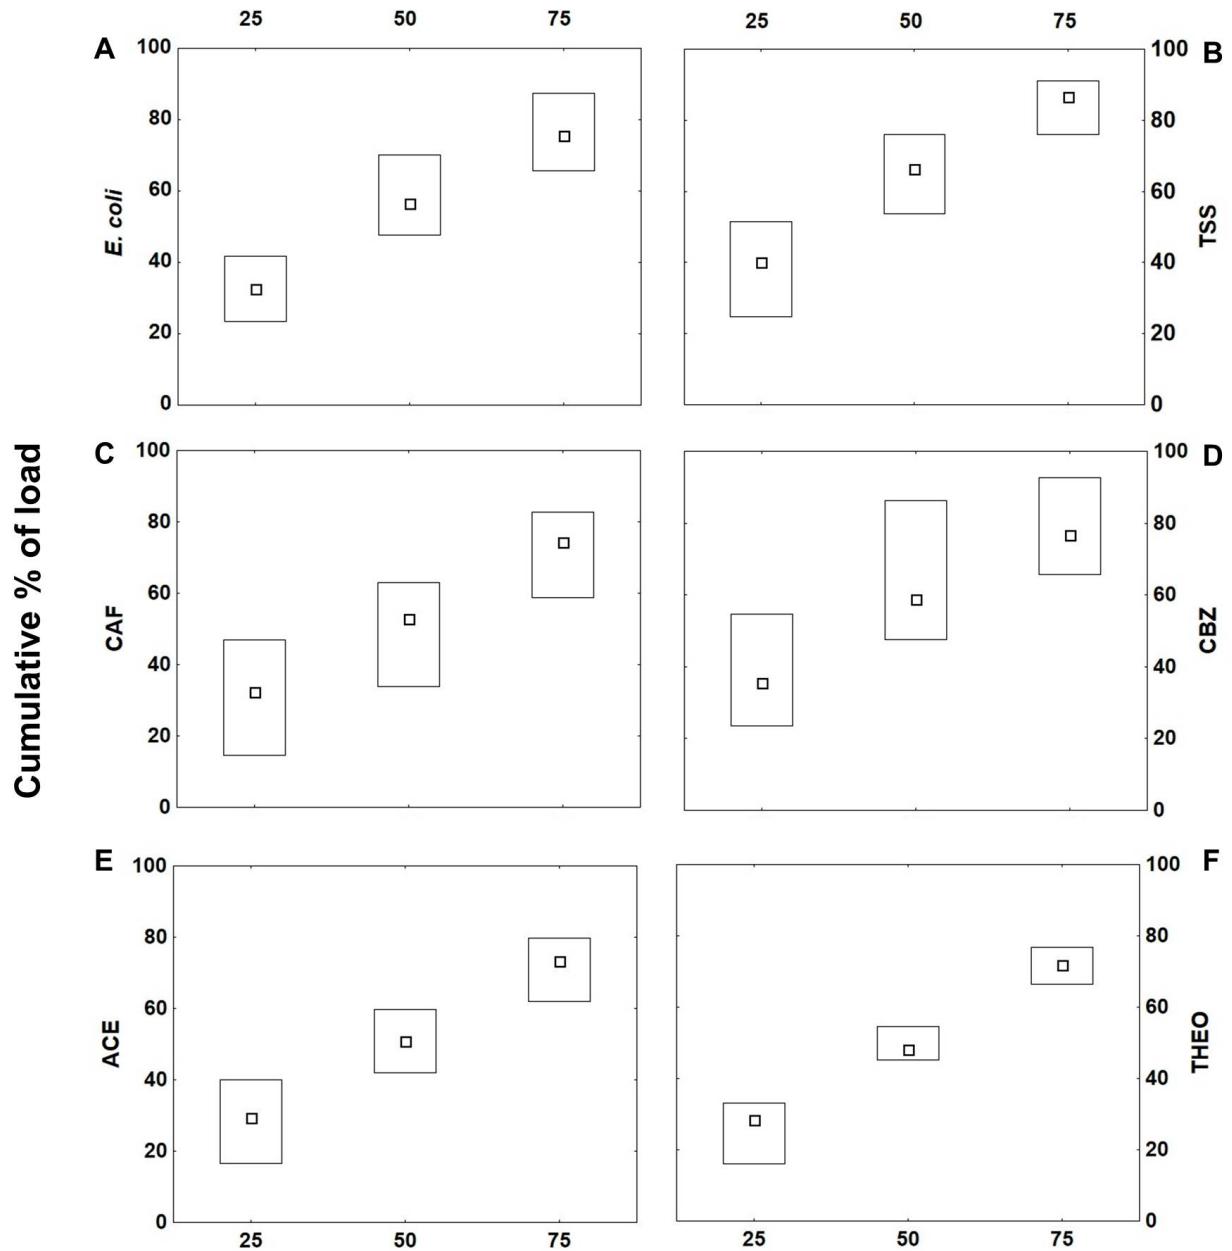

Figure S3: Cumulative percentage of load discharged versus cumulative fraction of discharged volume. (A) *E. coli*, (B) TSS (C) CAF, (D) CBZ, (E) ACE, (F) THEO.

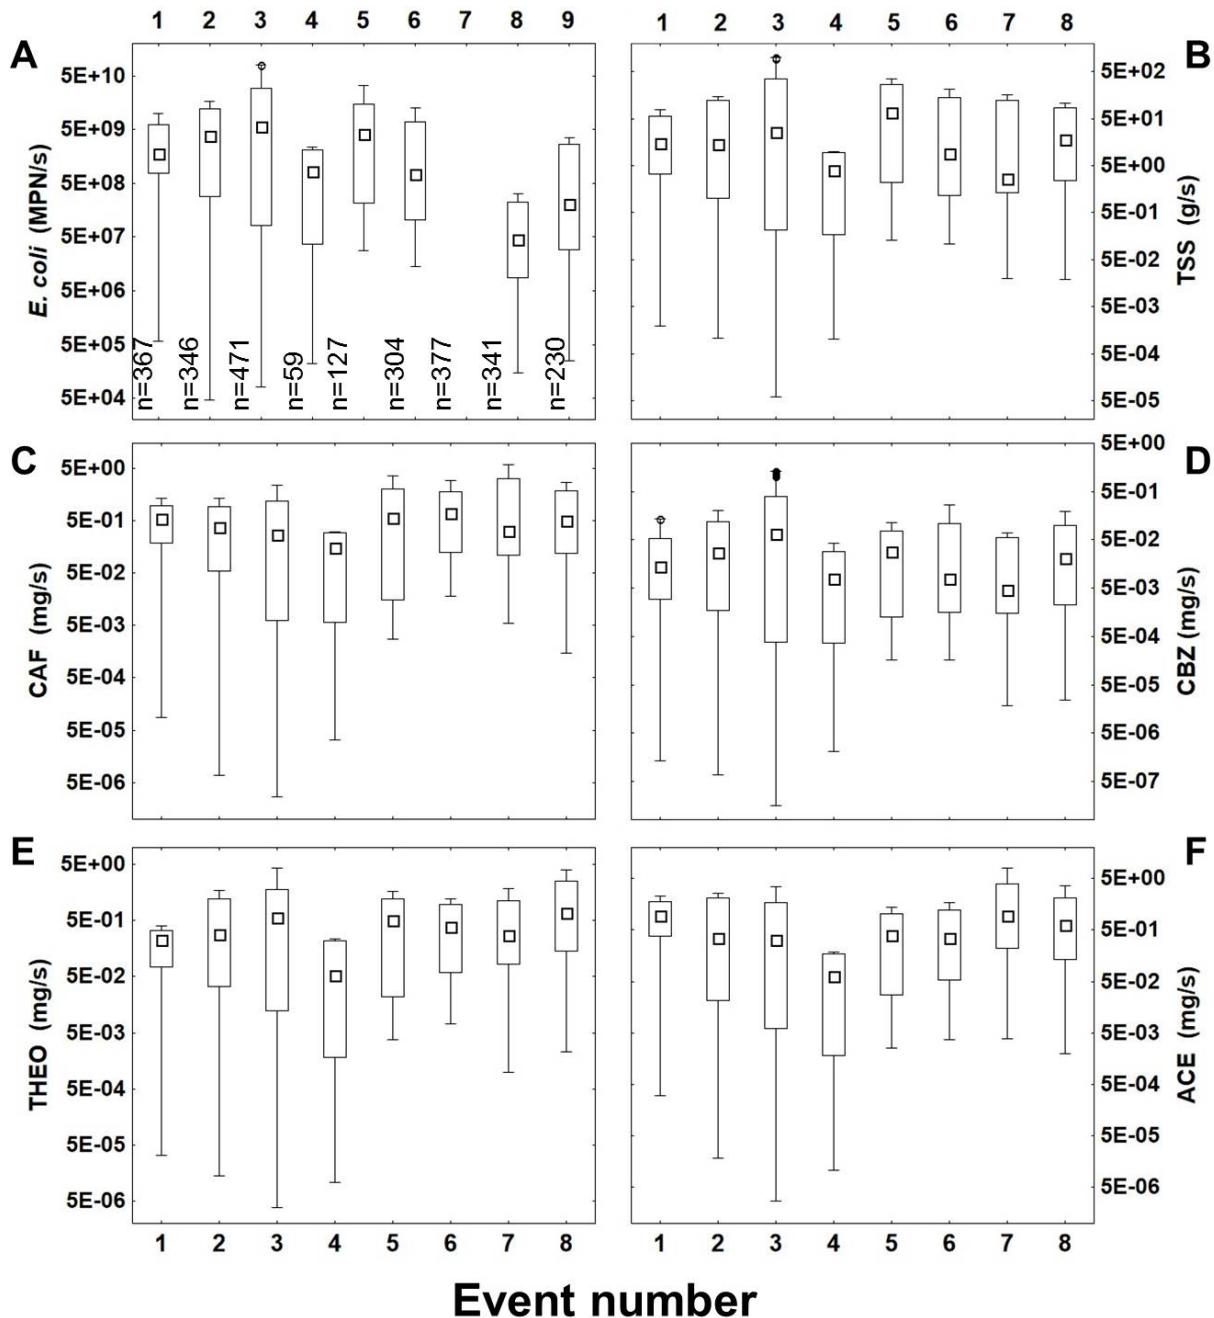

Figure S4: Box-plots of pollutant loads measured in CSOs for different events. (A) $E. coli$, (B) TSS, (C) CAF; (D): CBZ; (E) THEO, (F) ACE. The number of interpolated values (n) is indicated in box A.

Table

Table S1: Impact of EMC on each of the responses

effect	df	Log <i>E. coli</i> p	logCAF p	logCBZ p	logACE p	logTHEO p	logTSS p
intercept	1	0,000453	0,000000	0,000000	0,000000	0,000083	0,000012
Log flow	1	0,931557	0,000261	0,000027	0,003144	0,117484	0,583767
EMC	2	0,000083	0,000637	0,000496	0,012668	0,007178	0,000000
Error	22						
Total	25						
Significant responses are in bold font							

In all cases the EMC factor has a highly significant impact on each of the responses.
