I. General information:

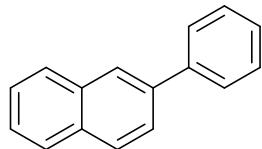

All reagents were purchased from Sigma-Aldrich and Alfa Aesar. Solvents purchased from commercial suppliers and used without further purification. GC equipped flame ionization detector with a capillary column (Elite-1, 30 m × 0.32 mm × 0.25 µm) was carried out for gas chromatography analysis. GC-MS-QP 2010 instrument (Rtx-17, 30 m × 25 mm ID, film thickness 0.25 µm df) (column flow 2 mLmin⁻¹, 80 °C to 240 °C at 10°/min rise). Products were purified by flash chromatography on 60-120 mesh silica gels, SiO₂. ¹H and ¹³C NMR spectra were recorded at 400 and 500 MHz (¹H NMR), 100 MHz (¹³C NMR) frequency in CDCl₃. All chemical shifts are given as δ value (ppm) with reference to tetramethylsilane (TMS) as an internal standard. All reagents were weighed and handled in air.

II. Typical procedure for the synthesis of 2-phenylnaphthalenes from styrene oxides:

A mixture of 1a (1 mmol), and [HNMP]⁺HSO₄⁻ (4 mmol) was stirred at 100 °C in a sealed 10 mL tube for 8 h. The progress of the reaction was monitored by gas chromatography. After the completion of reaction, it was cooled to room temperature. The reaction mixture was extracted with diethyl ether (3 × 8 mL) and the combined organic layers was washed with water (10 mL). The organic layer was dried over anhydrous Na₂SO₄ and evaporated under the reduced pressure to furnish the crude product. It was purified by column chromatography (silica gel, 60–120 mesh; petroleum ether) to give the corresponding product 2a in 80% yield. The structure of the product was confirmed by GC-MS, ¹H NMR, ¹³C NMR spectroscopic techniques. The purity of the compound was determined by GC-MS analysis.
