<sup>a</sup>Time of polymerization was measured by quenching the polymerization reaction when all the monomer were found to be consumed. <sup>b</sup>Measured by GPC at 27 °C in THF relative to polystyrene standards with Mark-Houwink corrections for  $M_n$ . <sup>c</sup> $M_n^{(\text{theoretical})}$  at 100% =  $[M]_0/[C]_0 \times \text{molecular weight of monomer} + \text{molecular weight of end group}$ . <sup>d</sup>TOFs were calculated as (mol of LA consumed) / (mol of catalyst  $\times$  time of polymerization).
