Isolation of elemental sulfur and gas-phase analysis

The 2.5 mmol-scale reaction of **1a** was carried out using H₆PV₃Mo₉O₄₀ under the standard reaction conditions. After **1a** was quantitatively converted into **2a**, acetonitrile was completely removed by evaporation. Then, the residue (containing elemental sulfur, **2a**, and HPA) was washed with a mixture of ethanol and water (10/1 v/v) to remove **2a** and HPA, giving 59 mg of elemental sulfur (74 % based on **1a**). In addition, the 0.25 mmol-scale reaction of **1a** was carried out using H₆PV₃Mo₉O₄₀ under the standard reaction conditions, and the gas-phase was analyzed by MS spectrometry during the reaction. We confirmed by the MS analysis that SO₂ was not formed during the reaction. Therefore, the by-product of the present transformation is elemental sulfur, and sulfur is not oxidized to SO₂ under the present conditions.
