## Endothelial Cells Viability Assay

The human umbilical vein endothelial cells (HUVECs) viability assay was performed according to previous studies ${ }^{1,2}$ with minor modifications by using a cell counting kit-8 (CCK-8, Beyotime, China). Typically, $\sim 2.0 \times 10^{4}$ cells were grown in a 96 -well plate and cultured in DMEM medium with $10 \%$ fetal bovine serum (FBS) and maintained in a humidified $37^{\circ} \mathrm{C}$ incubator with $5 \% \mathrm{CO}_{2}$. After culturing for 24 h , the cells were mildly washed with $150 \mu \mathrm{~L}$ of serum-free DMEM medium (SFM) for two times and then incubated with $150 \mu \mathrm{~L}$ of SFM with different sample concentrations. After contacting with the materials for 24 h , the cells were washed twice with SFM. Subsequently, $100 \mu \mathrm{~L}$ of SFM and $15 \mu \mathrm{~L}$ of CCK-8 solution was added into each well. After incubating for $1.5 \mathrm{~h}, 80 \mu \mathrm{~L}$ of the SFM was transferred to a new 96-well plate and the absorbance was measured at 450 nm with 650 nm as reference by using a Microplate reader (Synergy ${ }^{\mathrm{TM}} \mathrm{H} 1$, BioTek). The cell experiments were repeated three times and the statistical significance was calculated by Student's $t$-test. The cell viability was determined by the ratio of absorbance between sample groups and control groups.

## Enrichment of Standard Glycoprotein

For selective capture of standard glycoprotein, 0.1 mg GO@BPEI@Con A composites were firstly dissolved in 1 mL binding buffer ( $0.15 \mathrm{M} \mathrm{NaCl}, 10 \mathrm{mM}$ HEPES, $0.5 \mathrm{mM} \mathrm{MnCl}{ }_{2}$ and $1 \mathrm{mM} \mathrm{CaCl} 2, \mathrm{pH}$ 7.5). Then, protein mixture contained $1.0 \mu \mathrm{~g}$ RNase B and $500 \mu \mathrm{~g}$ Myo were added. After incubating for 1 $h$ at room temperature, the composites were washed five times with binding buffer to remove the unbounded proteins. Subsequently, $20 \mu \mathrm{~L}$ elution buffer ( $0.5 \mathrm{M} \mathrm{NaCl}, 10 \mathrm{mM}$ HEPES, $0.5 \mathrm{mM} \mathrm{MnCl}, 1$ $\mathrm{mM} \mathrm{CaCl} 2, ~ 0.2 \mathrm{M}$ methyl- $\alpha$-D-mannopyranoside and 0.2 M methyl- $\alpha$-D-glucopyranoside, pH 7.0 ) was added into the composites and incubated for 15 min . Finally, the captured glycoprotein was specifically eluted with elution buffer and the supernatant was analyzed by MALDI-TOF MS.

The glycoprotein enrichment capacity of GO@BPEI@Con A is defined as the glycoprotein amount difference between the total glycoprotein used and the residual glycoprotein present in the supernatant after adsorption. To removal physical adsorbed glycoproteins as far as possible, the specific absorbed glycoproteins were washed another time and centrifuged, the supernatant was merged and the amount of glycoprotein was determined by BCA assay after supernatant was filtered by a 3 kDa filtration unit to remove the elution buffer.

Hepatocarcinoma ascites syngeneic cell lines (Hca) were presented by the Dalian Medical University. Hca cells were firstly washed three times with ice-cold PBS to remove blood and isolated by centrifugation $(500 \times \mathrm{g}, 5 \mathrm{~min})$ at room temperature. Then, the collected cells were homogenized in buffer composed of 8 M urea and $1 \%(\mathrm{v} / \mathrm{v})$ protease inhibitor cocktail in an ice bath. The resulting homogenate was centrifuged at $20000 g$ for 30 min . Finally, the supernatant was collected and the protein concentration was determined by the BCA assay. All samples were stored at $-80^{\circ} \mathrm{C}$ pending further use.

For capture of glycoproteins extracted from Hca, the mixture of $0.5 \mathrm{mg} \mathrm{GO} @ B P E I @ C o n A$ and 0.5 mg GO@BPEI@WGA were firstly dissolved in 1 mL binding buffer, then $50 \mu \mathrm{~g}$ proteins from Hca were added and incubated for 2 h at room temperature. The unbounded proteins were removed with $400 \mu \mathrm{~L}$ binding buffer for five times. The glycoproteins were recovered by washing two times with $300 \mu \mathrm{~L}$ elution buffer ( $0.5 \mathrm{M} \mathrm{NaCl}, 10 \mathrm{mM}$ HEPES, $0.5 \mathrm{mM} \mathrm{MnCl} 2,1 \mathrm{mM} \mathrm{CaCl} 2,0.2 \mathrm{M}$ methyl- $\alpha$-D-mannopyranoside, 0.2 M methyl- $\alpha$-D-glucopyranoside and 0.4 M N -acetyl-D-glucosamine, pH 7.0 ). Then, the collected proteins were concentrated by centrifugal ultrafiltration with 3 kDa filtration units to remove the monosaccharide and redissolved in 8 M urea. Then, the proteins were reduced in 20 mM DTT at $56^{\circ} \mathrm{C}$ for 2 h and alkylated in 50 mM IAA at room temperature for 30 min in the dark. After that, the solution was diluted 10 -fold with $50 \mathrm{mM} \mathrm{NH} \mathrm{H}_{4} \mathrm{HCO}_{3}(\mathrm{pH} 8.0)$ to decrease the urea concentration below 1 M . Subsequently, trypsin was added at an enzyme/substrate ratio $(\mathrm{m} / \mathrm{m})$ of 1:30 and incubated at $37^{\circ} \mathrm{C}$ for 16 h. After $2 \mu \mathrm{~L}$ of formic acid was added into the solution to terminate the reaction, the tryptic digests were desalted by homemade RP C18 precolumn and then dried down in a Speed Vac Concentrator (Thermo, CA). Next, the tryptic digests were redissolved in $20 \mathrm{mM} \mathrm{NH}_{4} \mathrm{HCO}_{3}$ and 100 units of PNGase F was added and incubated at $37^{\circ} \mathrm{C}$ for 16 h . Finally, the solution was dried down and stored at $-80^{\circ} \mathrm{C}$ pending further analysis.

Compared with the enrichment of glycoprotein by the above-mentioned composites, the amount of commercial agarose bound WGA and agarose bound Con A was 5 mg , respectively, 10-fold amount more than GO composites. Other conditions were the same as described above.

## MS Analysis and Database Searching

MALDI-TOF MS analysis was performed on Ultraflex III TOF/TOF (Bruker Daltonics, Bremen, Germany). Sinapinic acid (SA) matrix solution ( $20 \mathrm{mg} / \mathrm{mL}$ ) was prepared in $\mathrm{ACN} / \mathrm{H}_{2} \mathrm{O} / \mathrm{TFA}$ ( $50: 50: 0.1$ ). one microliter amount of the sample and SA solution were sequentially spotted on the MALDI plate for MS analysis.

The tryptic digests were analyzed on a LTQ-Orbitrap Velos (Thermo, CA) mass spectrometer coupled with an Accela 600 HPLC system (Thermo, CA). The mobile phase A was $2 \% \mathrm{ACN}$ with $0.1 \%$ formic acid and phase B was $98 \% \mathrm{ACN}$ with $0.1 \%$ formic acid. The samples were automatically loaded onto a C18 trap column ( $150 \mu \mathrm{~m}$ i.d. $\times 5 \mathrm{~cm}$ ) which connected to a homemade capillary separation column ( 75 $\mu \mathrm{m}$ i.d. $\times 15 \mathrm{~cm}$ ). To achieve sufficient separation, an 85 -min linear gradient ( $10 \%$ to $35 \%$ phase B) was employed with the flow rate at $280 \mathrm{~nL} / \mathrm{min}$. The LTQ-Orbitrap Velos was operated with a 2.0 kV spray voltage in positive mode, and the temperature of ion transfer capillary was $250{ }^{\circ} \mathrm{C}$. The normalized collision energy was set at $35.0 \%$. One microscan was set for each MS and MS/MS scan. All MS and MS/MS spectra were obtained in a data-dependent mode with one MS scan followed by $20 \mathrm{MS} / \mathrm{MS}$ scans in CID mode. The scan range was set from $\mathrm{m} / \mathrm{z} 300$ to $\mathrm{m} / \mathrm{z} 1800$. The dynamic exclusion function was set as follows: repeat count 1 , repeat duration 40 s , and exclusion duration 40 s . All MS/MS spectra by nano-RPLC-ESI-MS/MS analysis were searched against the mouse IPI database (v3.68) in Mascot (version 2.3.2). Mass tolerances for LTQ-Orbitrap Velos were set as 10 ppm for parent ions and 0.5 Da for
fragments. Cysteine residues was searched as a fixed modification of +57.0215 Da . Oxidation (M) $(+15.9949 \mathrm{Da})$ and deamidation $(\mathrm{N})(+0.9840)$ were searched as variable modification, respectively. Peptides were searched using fully tryptic cleavage constraints, and up to 2 missed cleavages. The search results were filtered by pBuild to control the $\mathrm{FDR} \leq 1 \%$.
