## Supplementary Information

## A dual optical and nuclear imaging reagent for peptide labelling via disulfide bridging

Sally A. Fletcher, Pak Kwan Brian Sin, Muriel Nobles, Erik Årstad, Andrew Tinker, James R. Baker

Supplementary Figure 1: ESI-mass spectroscopy of reduced octreotide and modified octreotide 2.

ESI mass spectrum of $\mathbf{A )}$ peak at $m / z 1021.7$ corresponding to reduced octreotide (expected mass $=m / z 1021.3)$ and $\mathbf{B}$ ) peak at $m / z 1152.8$ corresponding to alkyne modified octreotide $2($ expected mass $=m / z 1151.55)$.

Supplementary Figure 2: Typical current recordings from GIRK1/2a channel at rest and after activation.

Current recordings of A) the resting GIRK 1/2a channel and B) GIRK1/2a channel activation by octreotide ( 100 nM ). Current was recorded over 20 mV voltage steps, over a range of -120 to +40 mV from a holding potential of -50 mV .

Supplementary Table 1: Data for the dose-response curve of native octreotide (0100 nM )

Supplementary Figure 3: ESI-mass spectroscopy of reduced octreotide and octreotide MOMIA.

ESI mass spectrum of A) peak at $m / z 1021.4$ corresponding to reduced octreotide $($ expected mass $=m / z 1021.3)$ and $\mathbf{B})$ peak at $m / z 1943.31$ corresponding to modified octreotide and (expected mass $=m / z$ 1942.51). Note: see below for expanded range of spectrum B, confirming the absence of remaining starting material; peak at 972 is the $\mathrm{M}^{2+}$ peak.

## Supplementary Methods

## General Experimental

Synthetic reactions were all carried out at room temperature and under an inert atmosphere unless otherwise stated. All commercially available reagents were used as received without further purification. Octreotide was obtained from LKT Laboratories.
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on either a Brüker Avance-500 machine or a Brüker Avance- 600 machine (as stated), ran at a frequency of 500 MHz and 600 MHz respectively for ${ }^{1} \mathrm{H}$ spectra and 125 MHz and 150 MHz respectively for ${ }^{13} \mathrm{C}$ spectra. Deuterated solvents used were obtained from Sigma Aldrich. Peaks are assigned as singlet ( s ), doublet (d), triplet ( t ) or multiplet (m) and are sharp peaks unless denoted as broad (br). Chemical shifts are recorded in parts per million (ppm) denoted by $\delta$. Proton coupling constants ( $J$ values) are reported in Hertz (Hz). Where necessary, assignments were confirmed with the aid of DEPT spectra.

Mass spectra were recorded on a VG70-SE mass spectrometer running in EI or CI mode.

Infra-red (IR) spectra were recorded on a PerkinElmer Spectrum 100 FT-IR spectrometer operating in ATR mode.

LC-MS measurements were taken on an Acquity Ultra Performance LC instrument. LC data was recorded at a wavelength of 280 nm and MS data obtained in $\mathrm{ES}^{+}$and ES' mode with a detection range between $m / z 90-2000$. LC solvent solutions: A $\mathrm{H}_{2} \mathrm{O}(0.1 \% \mathrm{TFA}) ; \mathrm{B}-\mathrm{MeCN}(0.1 \% \mathrm{TFA})$; running conditions: Gradient 5-95\% B in 5 min ; injection volume: $10 \mu \mathrm{~L}$. Masses are assigned as a mass to charge ratio $(\mathrm{m} / \mathrm{z})$. Octreotide was obtained from LKT Laboratories. Lyophilised octreotide was resolubilised in buffer ( $2 \mathrm{~mL}, 50 \mathrm{mM} \mathrm{NaHPO}_{4}^{-}, \mathrm{pH} 6.2,40 \% \mathrm{MeCN}, 2.5 \%$ DMF) and stored at $4^{\circ} \mathrm{C}$ until use.

Peptide concentrations were determined using a nanodrop ND-1000 spectrophotometer.
'Peptide buffer' employed in experiments consisted of pH 6.2 phosphate buffer ( 50 mM ) with $40 \% \mathrm{MeCN}$ and $2.5 \% \mathrm{DMF}$.

For peptide purification by RP-HPLC, a Shimadzu LC-10AT instrument fitted with a $\mathrm{C}_{18}$ column, $150 \times 4.60 \mathrm{~mm}$ (Phenomenex) was used for all purification procedures.

The mobile phases were water, $0.1 \%$ TFA (solvent A) and acetonitrile, $0.1 \%$ TFA (solvent B). Flow rate of $1 \mathrm{~mL} / \mathrm{min}$. Species eluting from the column was monitored by measuring the absorbance at 280 nm . A fraction collector was used to collect the desired peaks ( 1 mL fractions) and identical fractions were pooled before being lyophilised using a Scanvac vacuumed centrifuge (Labmode). The residual peptide was reconstituted in distilled water (RP-HPLC-grade, Fisher Chemicals).

RP-HPLC purification method:

| Time (min) | Solvent B <br> $(\%)$ |
| :---: | :---: |
| 1.0 | 0 |
| 15.0 | 60 |
| 19.0 | 60 |
| 22.0 | 90 |
| 24.50 | 0 |
| 30.0 | 0 |

## Protocol for the modification of octreotide

Octreotide ( $140 \mu \mathrm{~L}, 643 \mu \mathrm{M}$ ) was diluted to a concentration of $300 \mu \mathrm{M}$ using peptide buffer ( $160 \mu \mathrm{~L}$ ). TCEP $(5.93 \mathrm{mg})$ was prepared at a concentration of 30 mM using peptide buffer $(690 \mu \mathrm{~L})$ before 1.2 equivalents $(3.60 \mu \mathrm{~L}, 0.108 \mu \mathrm{~mol})$ of this was added to the octreotide solution and mixed. The peptide was left to reduce for 1 h before an aliquot ( $30 \mu \mathrm{~L}$ ) was removed and analysed by LC-MS to ensure complete disulfide reduction. A solution of the desired maleimide reagent was prepared at a concentration of 30 mM using DMF. 1.2 equivalents ( $3.24 \mu \mathrm{~L}, 0.097 \mu \mathrm{~mol}$ ) of the maleimide solution were added to the reduced octreotide and mixed. After 10 min , an aliquot $(30 \mu \mathrm{~L})$ of this reaction mixture was removed and analysed by LC-MS to ensure full conversion to the bridged product.

For modification of octreotide with maleimide 1, LC retention time of the bridged product $2(\mathrm{~m} / \mathrm{z} 1152.8)$ was 1.10 min .

For modification of octreotide with maleimide 4, LC retention time of the bridged product ( $\mathrm{m} / \mathrm{z} 1943.31$ ) was 1.75 min .

## N-(9-(2-(4-((tert-butoxycarbonyl)amino)piperidine-1-carbonyl)phenyl)-6-

 (diethylamino)-3H-xanthen-3-ylidene)- N -ethylethanaminium chloride (5) ${ }^{1}$

Rhodamine B ( $427 \mathrm{mg}, 0.891 \mathrm{mmol}$ ) was dissolved in DCM ( 30 mL ), oxalyl chloride $(2.5 \mathrm{~mL})$ was added and the reaction mixture stirred for 2 h . The solvent and excess oxalyl chloride was removed in vacuo. The purple residue was re-dissolved in DCM $(15 \mathrm{~mL})$ before being slowly added to a solution of $\mathrm{Cs}_{2} \mathrm{CO}_{3}(1.50 \mathrm{~g} .4 .56 \mathrm{mmol})$ and 4 -( $N$-Boc-amino)-piperidine ( $913 \mathrm{mg}, 4.56 \mathrm{mmol}$ ) in DCM ( 15 mL ). The mixture was stirred for 18 h before the solvent was removed in vacuo to yield the crude product as a purple solid. This was purified by flash chromatography on silica gel (DCM : MeOH , gradient elution from $98: 2$ to $90: 10$ ) to afford the product 5 as a dark purple solid ( $331 \mathrm{mg}, 59 \%$ ).

IR $v_{\max }$ (oil): 2977 (w), 2910 (w), 1702 (m), 1584 (m) cm ${ }^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , MeOD): $\delta=7.77-7.74$ (m, 2H), 7.64 (dd, $1 \mathrm{H}, J=6.0,3.0 \mathrm{~Hz}$ ), 7.49 (dd, $1 \mathrm{H}, J=6.0$, $2.5 \mathrm{~Hz}), 7.27(\mathrm{~d}, 2 \mathrm{H}, J=9.5 \mathrm{~Hz}), 7.08-7.07(\mathrm{~m}, 2 \mathrm{H}), 6.97(\mathrm{~d}, 2 \mathrm{H}, J=2.5 \mathrm{~Hz}), 4.08-$ $4.05(\mathrm{~m}, 1 \mathrm{H}), 3.71-3.67(\mathrm{~m}, 9 \mathrm{H}), 3.45-3.42(\mathrm{~m}, 1 \mathrm{H}), 3.03(\mathrm{bs}, 1 \mathrm{H}), 2.68-2.65(\mathrm{~m}, 1 \mathrm{H})$ $1.77-1.73(\mathrm{~m}, 2 \mathrm{H}), 1.40(\mathrm{~s}, 9 \mathrm{H}), 1.31(\mathrm{t}, 12 \mathrm{H}, J=7.5 \mathrm{~Hz}), 1.18-1.15(\mathrm{~m}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 MHz, MeOD): $\delta=169.3$ (C), 159.3 (C), 157.6 (C), 157.2 (C), 157.1 (C), 137.1 (C), 133.3 (CH), 132.0 (C), 131.7 (CH), 131.3 (CH), $131.0(\mathrm{CH}), 128.6(\mathrm{CH})$, $115.5(\mathrm{CH}), 115.3(\mathrm{C}), 97.4(\mathrm{CH}), 80.1(\mathrm{C}), 48.9(\mathrm{CH}), 48.5\left(\mathrm{CH}_{2}\right), 46.9\left(\mathrm{CH}_{2}\right), 41.8$ $\left(\mathrm{CH}_{2}\right), 33.5\left(\mathrm{CH}_{2}\right), 32.3\left(\mathrm{CH}_{2}\right), 28.8\left(\mathrm{CH}_{3}\right), 12.9\left(\mathrm{CH}_{3}\right)$; MS $(\mathrm{EI}+) \mathrm{m} / \mathrm{z}: 625(100 \%$, $\mathrm{M}^{+}$), 372 (30\%); Mass calculated for $\left[\mathrm{C}_{38} \mathrm{H}_{49} \mathrm{~N}_{4} \mathrm{O}_{4}\right]$ : 625.3754; Found: 625.3761.

## 1-(2-(6-(diethylamino)-3-(diethyliminio)-3H-xanthen-9-yl)benzoyl)piperidin-4-

 aminium 2,2,2-trifluoroacetate chloride (6) ${ }^{1}$

TFA ( 15 mL ) was added to a stirred solution of Boc-protected rhodamine $5(257 \mathrm{mg}$, $0.410 \mathrm{mmol})$ in DCM $(15 \mathrm{~mL})$ and the solution stirred for 4 h . The solvent was then removed azeotropically using toluene ( $3 \times 15 \mathrm{~mL}$ ) followed by chloroform ( $4 \times 10$ mL ) to yield the product $\mathbf{6}$ as a purple solid ( 402 mg , quantitative yield).
m.p. 231-234 ${ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{MeOD}$ ): $\delta=7.81-7.79(\mathrm{~m}, 2 \mathrm{H}), 7.69-7.68(\mathrm{~m}$, $1 \mathrm{H}), 7.53-7.52(\mathrm{~m}, 1 \mathrm{H}), 7.30(\mathrm{~d}, 2 \mathrm{H}, J=9.5 \mathrm{~Hz}), 7.15-7.05(\mathrm{~m}, 2 \mathrm{H}), 7.0-6.96(\mathrm{~m}$, $2 H), 4.34-4.31(\mathrm{~m}, 1 \mathrm{H}), 3.90-3.84(\mathrm{~m}, 1 \mathrm{H}), 3.74-3.69(\mathrm{~m}, 9 \mathrm{H}), 3.05-2.95(\mathrm{~m}, 1 \mathrm{H})$, $2.60-2.55(\mathrm{~m}, 1 \mathrm{H}), 1.99-1.97(\mathrm{~m}, 2 \mathrm{H}), 1.46-1.39(\mathrm{~m}, 2 \mathrm{H}), 1.34(\mathrm{t}, 12 \mathrm{H}, J=7.5) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{MeOD}$ ): $\delta=169.6$ (C), 162.4 (C), 159.3 (C), 157.3 (C), 156.8 (C), 136.7 (C), $133.4(\mathrm{CH}), 132.0(\mathrm{C}), 131.9(\mathrm{CH}), 131.4(\mathrm{CH}), 131.3(\mathrm{CH}), 128.4(\mathrm{CH})$, $117.0(\mathrm{C}), 115.4(\mathrm{CH}), 115.3(\mathrm{CH}), 115.1(\mathrm{C}), 97.4(\mathrm{CH}), 46.9\left(\mathrm{CH}_{2}\right), 31.4\left(\mathrm{CH}_{2}\right)$, $30.5\left(\mathrm{CH}_{2}\right), 12.8\left(\mathrm{CH}_{3}\right) ; \mathrm{MS}(\mathrm{EI}+) m / z: 525\left(100 \%, \mathrm{M}^{+}\right), 338(10 \%)$; Mass calculated for $\left[\mathrm{C}_{38} \mathrm{H}_{41} \mathrm{~N}_{4} \mathrm{O}_{2}\right]$ : 525.3230; Found: 525.3238.

A mixture of 6-bromohexanoic acid ( $402 \mathrm{mg}, 2.06 \mathrm{mmol}$ ) and sodium azide ( 668 mg , $10.3 \mathrm{mmol})$ in DMF $(1.5 \mathrm{~mL})$ was stirred at $50^{\circ} \mathrm{C}$ for 3 h . The mixture was cooled to room temperature and DCM ( 30 mL ) added. The organic phase was washed with water ( $2 \times 30 \mathrm{~mL}$ ), saturated aqueous $\mathrm{LiCl}(5 \times 30 \mathrm{~mL})$ and brine ( $2 \times 30 \mathrm{~mL}$ ), dried $\left(\mathrm{MgSO}_{4}\right)$ and the solvent removed in vacuo. The crude product was purified by flash chromatography on silica gel (petroleum ether : ethyl acetate, gradient elution from 8 : 2 to $6: 4$ ) to afford the product 7 as a colourless liquid ( $124 \mathrm{mg}, 39 \%$ ).

IR $v_{\max }($ oil $): 3200(\mathrm{~m}), 2925(\mathrm{~m}), 2095(\mathrm{~m}), 1702(\mathrm{~s}) \mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta=3.28(\mathrm{t}, 2 \mathrm{H}, J=7.0 \mathrm{~Hz}), 2.37(\mathrm{t}, 2 \mathrm{H}, J=7.5 \mathrm{~Hz}), 1.68-1.60(\mathrm{~m}, 4 \mathrm{H}), 1.45-$ $1.43(\mathrm{~m}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=180.0(\mathrm{C}), 51.3\left(\mathrm{CH}_{2}\right), 33.9\left(\mathrm{CH}_{2}\right)$, $28.6\left(\mathrm{CH}_{2}\right), 26.2\left(\mathrm{CH}_{2}\right), 24.2\left(\mathrm{CH}_{2}\right)$; MS $(\mathrm{EI}+)$ as sodium adduct $m / z: 180(100 \%$, $\mathrm{M}+\mathrm{Na}^{+}$); Mass calculated for [ $\left.\mathrm{C}_{6} \mathrm{H}_{11} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{Na}\right]$ : 180.0749; Found: 180.0733.

$N$-(9-(2-(4-(6-azidohexanamido)piperidine-1-carbonyl)phenyl)-6-(diethylamino)3 H -xanthen-3-ylidene)- N -ethylethanaminium chloride (3)

To a solution of 6-azidohexanoic acid $7(29.5 \mathrm{mg}, 0.189 \mathrm{mmol})$, HBTU ( 71.7 mg , $0.189 \mathrm{mmol})$, and HOBt ( $25.5 \mathrm{mg}, 0.189 \mathrm{mmol}$ ) in DMF ( 2 mL ) was added DIPEA ( $99.0 \mu \mathrm{~L}, 0.576 \mathrm{mmol}$ ) in DMF ( 2 mL ). The reaction mixture was stirred for 20 min before a solution of rhodamine B-amine $\mathbf{6}(99.3 \mathrm{mg}, 0.189 \mathrm{mmol})$ in DMF ( 2 mL ) was added drop-wise and the mixture stirred for 3 h . The solvent was then removed in vacuo and the crude product re-dissolved in DCM $(10 \mathrm{~mL})$ before being washed with saturated aqueous $\mathrm{LiCl}(3 \times 10 \mathrm{~mL}), 15 \%$ aqueous $\mathrm{K}_{2} \mathrm{CO}_{3}(2 \times 10 \mathrm{~mL}), 15 \%$ aqueous citric acid ( $2 \times 10 \mathrm{~mL}$ ) and water ( 2 x 10 mL ). The resulting product was dried $\left(\mathrm{MgSO}_{4}\right)$ and the remaining solvent removed in vacuo before being purified by flash chromatography on silica gel (DCM : MeOH , gradient elution from $100: 0$ to $96: 4$ ) to yield the product $\mathbf{3}$ as a purple solid ( $96.9 \mathrm{mg}, 77 \%$ yield).

N -(6-(diethylamino)-9-(2-(4-(6-(4-((2,5-dioxo-3,4-bis(phenylthio)-2,5-dihydro-1 H -pyrrol-1-yl)methyl)-5-iodo-1 $\mathbf{H}-1,2,3$-triazol-1-yl)hexanamido)piperidine-1carbonyl) phenyl)-3H-xanthen-3-ylidene)- N -ethylethanaminium (4) ${ }^{3}$

To a solution of copper (I) iodide ( $8.00 \mathrm{mg}, 0.0420 \mathrm{mmol}$ ) in dry acetonitrile ( 5 mL ) was added $N$-alkyne dithiophenolmaleimide $\mathbf{1}^{4}(13.4 \mathrm{mg}, 0.0380 \mathrm{mmol})$, rhodamineazide 3 ( $27.9 \mathrm{mg}, 0.0420 \mathrm{mmol}$ ), triethylamine ( $5.3 \mu \mathrm{~L}, 0.0380 \mathrm{mmol}$ ) and $N-$ chlorosuccinimide $(6.10 \mathrm{mg}, 0.0460 \mathrm{mmol})$ and the reaction mixture stirred overnight. The copper was removed by gravity filtration and the filtrate concentrated in vacuo. The crude product was purified by flash chromatography on silica gel (DCM : MeOH, gradient elution from $100: 0$ to $95: 5$ ) to afford the product 4 as a purple solid (15.9 mg, 37 \% yield).

## Synthesis of rhodamine B-[ $\left.{ }^{[25 I}\right]$-dithiophenol maleimide ( $\left.\left[{ }^{125} \mathrm{I}\right] 4\right)^{3}$

Radio-HPLC analysis was performed with an Agilent 1200 HPLC system equipped with a GABI Star $\mathrm{NaI}(\mathrm{Tl})$ scintillation detector and a Knauer Smartline fixed wavelength 254 nm UV-detector. A ZORBAX column (300SB-C18, $9.4 \times 250 \mathrm{~mm}$ ) was used. Reductant free [125I]NaI was purchased from Perkin Elmer with a concentration of $370 \mathrm{mCi} / \mathrm{mL}(13.69 \mathrm{GBq} / \mathrm{mL}$ ) and specific activity of $629 \mathrm{GBq} / \mathrm{mg}$ in $10-5 \mathrm{M} \mathrm{NaOH}(\mathrm{pH} 8-11)$ aqueous solution.

To copper(II) chloride ( $13.4 \mathrm{mg}, 0.100 \mathrm{mmol}$ ) was added anhydrous acetonitrile ( 4 mL ) followed by anhydrous triethylamine ( $20.9 \mu \mathrm{~L}, 0.150 \mathrm{mmol}$ ), and the mixture was mixed by vortex.

To the $N$-alkyne dithiophenolmaleimide $\mathbf{1}^{4}(0.35 \mathrm{mg}, 1.0 \mu \mathrm{~mol})$ was added the above solution of the $\mathrm{CuCl}_{2} /$ triethylamine complex in acetonitrile $(40 \mu \mathrm{~L})$ and the mixture vortexed. After $5 \mathrm{~min}, \mathrm{Na}^{125} \mathrm{I}$ in water $(6.00 \mu \mathrm{~L}, 1.438 \mathrm{MBq})$ was added to the mixture. Azide $3(6.64 \mathrm{mg}, 10.0 \mu \mathrm{~mol})$ was dissolved in $\mathrm{MeCN}(200 \mu \mathrm{~L})$ before 20 $\mu \mathrm{L}(1.00 \mu \mathrm{~mol})$ was added to the reaction mixture. The tube was capped and the reaction was heated at $60^{\circ} \mathrm{C}$ for 90 min . The reaction was quenched with acetonitrile and water $(1: 1,400 \mu \mathrm{~L})$ and the resulting solution was purified by HPLC (Buffer A: water +0.1 \% TFA, Buffer B: methanol + 0.1 \% TFA, gradient elution from $60-90 \%$ Buffer B over 30 min , flow rate $3 \mathrm{~mL} / \mathrm{min}$ ). The labelled compound [ $\left.{ }^{125} \mathrm{I}\right] 4$ was identified by co-injection and co-elution with the non-radioactive reference compound 4. The isolated RCY of $\left[{ }^{125} \mathrm{I}\right] 4$ was $47 \%$.

## Cell Culture for Patch Clamp Experiments

Cell-culture methods and the generation of stable cell lines were carried out as described. ${ }^{5}$ HEK293 (Human Embryonic Kidney cell line) stably expressing Kir3.1 and Kir3.2A channels were maintained in minimum essential medium (MEM) supplemented with $10 \%$ foetal calf serum and G-418 ( $800 \mu \mathrm{~g} / \mathrm{mL}$ ) (Invitrogen), at 37 ${ }^{\circ} \mathrm{C}$ in a humidified atmosphere $\left(95 \% \mathrm{O}_{2}, 5 \% \mathrm{CO}_{2}\right)$.

The BON-1 cell line is an immortalised human cell line derived from a metastatic carcinoid tumour of the pancreas and was kindly donated by Professor Meyer (UCL). The cell line was maintained in MEM : Ham's F-12 K Nutrient Mixture (F-12K) (1 : 1) supplemented with $10 \%$ foetal calf serum and $1 \%$ penicillin/streptomycin (Life Technologies).

The Phosphate Buffered Saline (PBS) and $0.25 \%$ trypsin solutions used were obtained from Gibco Life Technologies.

When cells were required for patch clamp experiments they were passaged directly onto glass coverslips ( 10 mm diameter, borosilicate glass, VWR International). The cells were incubated at $37^{\circ} \mathrm{C}$ for 2 days before use.

## Transfection of Cells

Cells were transiently co-transfected with 800 ng SSTR2 plasmid DNA (Missouri S\&T cDNA Resource Center) along with 50 ng eGFP plasmid DNA (Clontech) for visualization of transfected cells using epifluorescence. Transfections were performed with $5 \mu$ of Fugene HD (Roche).

## Electrophysiology

## Patch Clamp Equipment Setup

Whole cell patch-clamp current recordings were performed with an Axopatch 200B amplifier (Axon Instruments) using pipettes with a resistance of 3-4 $\mathrm{M} \Omega$ pulled from filamented borosilicate glass capillaries (Harvard Apparatus, 1.5 mm OD x 1.17 mm ID). Data was acquired and analysed via a Digidata 1440 interface (Axon Instruments) and captured and analysed using pClamp software (version 10.0, Axon Instruments). Voltage commands were generated using pClamp10 software. A gravity driven system was used to apply octreotide and modified analogues. From a holding potential of $-50 \mathrm{mV}, 20 \mathrm{mV}$ steps were applied from -120 mV to +40 mV . The extracellular solution was: $\mathrm{KCl}(20 \mathrm{mM}), \mathrm{NaCl}(120 \mathrm{mM}), \mathrm{CaCl}_{2}(2 \mathrm{mM}), \mathrm{MgCl}_{2}$ and HEPES ( 10 mM ), pH 7.4 while the intracellular solution was: $\mathrm{KCl}(130 \mathrm{mM}), \mathrm{NaCl}$ ( 10 mM ), $\mathrm{MgCl}_{2}(1 \mathrm{mM})$, MgATP ( 2 mM ), EGTA ( 2 mM ), GTP ( 0.3 mM ) and HEPES (10 mM), pH7.4.

Activation of the GIRK current was achieved by sequential perfusion with $0.01,0.1$, 1,10 and 100 nM octreotide or $1,10,100,10^{3}$ and $10^{4} \mathrm{nM}$ of bridged octreotide $\mathbf{2}$.

## Confocal Microscopy Imaging

## General Information

For these experiments, HEK293 cells stably expressing the GIRK1/2a channel and BON-1 cells were used.

Tyrode's solution used washing was: $\mathrm{NaCl}(135 \mathrm{mM}), \mathrm{KCl}(5.4 \mathrm{mM}), \mathrm{CaCl}_{2}(2 \mathrm{mM})$, $\mathrm{MgCl}_{2}(1 \mathrm{mM})$, HEPES $(5 \mathrm{mM})$ and glucose $(10 \mathrm{mM}), \mathrm{pH} 7.4$. The solution was stored at $4{ }^{\circ} \mathrm{C}$ and warmed to room temperature before use.

## Microscopy Imaging

Live cells were imaged using a Zeiss LSM510 confocal microscope and a PlanApochromat 63 x oil lens objective ( 1.4 numerical aperture). eGFP was visualized using a multi-line Argon laser (wavelength 488 nm ) and filtered using a BP505-530 (band pass) emission filter. Rhodamine B was visualised using a helium/neon laser (wavelength 543 nm ) and filtered using a BP560-615 emission filter. To avoid 'crosstalk' between eGFP and rhodamine B signals, images were acquired sequentially.

Images were taken at $1024 \times 1024$ frame size, a bit depth of 16 bit, and were averaged twice.

Cells were seeded and transfected with SSTR2 and eGFP onto Mattek petri dishes (Mattek Corporation). Cells were imaged in control conditions (in Tyrode's solution), and after incubation for 20 min at $37^{\circ} \mathrm{C}$ with octreotide-MOMIA ( $1 \mu \mathrm{M}$ ).
